SHORT NOTES

I. A NEW NAME FOR A CHINESE TURTLE GENUS
CLEMMYS.

In 1958, Li Tze-Hsun (1958) reported on a collection of 860 reptiles from the Island of Hainan, China, collected by a joint expedition of the biological departments of Fu-tan and Wu-han Universities in 1956-57. From this material Li described two new subspecies of turtles from the Island, viz.: Cyclomeys flavomarginata hainanensis (=Cuora flavomarginata hainanensis [new combination]) and Clemmys bealii quadriocellata.

The latter species was first recorded from Hainan by Schmidt (1927, pp. 403-4) as Clemmys bealii (Gray). Pope (1935, pp. 42-3) and others have been unable to separate the Hainan specimens taxonomically from those on the mainland of China. Further research may indicate that the Hainan population is deserving of a name. If this be the case, however, we must note that Li's quadriocellata is antedated by Clemmys bealii var. quadriocellata Siebenrock (Siebenrock, 1903; type locality: Phuc-Son, central Annam). For the past two years I attempted to reach Li by letter so he could make the correction, but with no success. Therefore, I propose Clemmys bealii insulensis as a substitute name for Clemmys bealii quadriocellata Li.
