CATALOGUE
OF
SHIELD REPTILES
IN
THE COLLECTION
OF
THE BRITISH MUSEUM.

PART I.
TESTUDINATA (TORTOISES).

BY
JOHN EDWARD GRAY, F.R.S. &c.

LONDON:
PRINTED BY ORDER OF THE TRUSTEES.
1855.
INTRODUCTION.

The chief object in preparing the present Catalogue has been to give at one view a complete account of all the species of the Shielded Reptiles (*Cataphracta*) now in the British Museum, and of those species known to exist in other Cabinets, but which are at present desiderata in the Museum, to enable travellers, collectors and others to assist in completing the national collection.

An indication of the separate locality of each specimen is given; its sex and state are also noticed.

The figures of the new species contained in the Museum Collection have been drawn on stone by Mr. Ford, so well known for the beauty and accuracy of his pencil.

JOHN EDWARD GRAY.

*British Museum, December 1, 1855.*
CATALOGUE

OF

SHIELD REPTILES.

Sect. II. SHIELDED REPTILES (CATAPHRAC'TA).

Body covered with square imbedded plates, generally forming a dorsal and ventral shield. The bones of the skull thick, united together into a hard mass, and including the quadrate bones and pterygoid processes. The tongue is short, affixed to the mouth, scarcely exertible. The lungs are enveloped by a thick peritoneum, which performs the part and has the appearance of a diaphragm. The vent is round or linear, plaited. The male organ and vagina are simple, the former having only a groove along its upper edge. Oviparous: the egg covered with a hard shell: the young, when hatched, having a large umbilical slit, which soon disappears.

Reptilia Cataphracta (Shielded Reptiles), Gray, Syg. Rept. 2 (1831); Ann. Nat. Hist. i. 275 (1838); Cat. Tort. R. M. (1841).

Order III. CHELONIA (TORTOISES).

The body enclosed in a case, formed of two shields united by their margins, and leaving only the head, neck, limbs and tail free, which are covered with a scaly skin; the upper shield or thorax formed of the ribs more or less dilated on the sides, united together and adherent to the dorsal vertebrae by a toothed suture, preventing any motion; they are surrounded by a series of bones forming the edge of the shields: the lower shield or sterna is formed of four pair and a central anterior bone. The jaws are toothless, covered with a hornly bill, rarely hid by fleshy lips: the upper bill covers the lower like a box. Eyes with distinct eyelids. The drum of the ear visible, nearly superficial. The legs short, thick. Tail conical. The vent is a circular hole.

Chelonia (Chelonians), Gray, Ann. Nat. Hist. i. 275 (1835); Cat. Tort. R. M.

Tortues ou Cheloniens, Dana, & Bib. Erp. Gén. ii. 1 (1833).

Testudinata, Oppel, Reptilien, 1811.
Fitz, Syst. Rept. 29 (1843).

Cheloni, Latr. Rept.
Gray, Ann. Philos. (1825); Syg. Rept. 3 (1831).

Chelonea, Fleming, Phil. Zool. ii. 268 (1822).

Cuv. R. A. ii. 6; ed. 2, ii. 5; Oss. Foss. v.
Latr. Rept.
Wiehmann & Ruther, Hauth. Zool. 163.

Testudinata, Fitz, Syst. Rept. 29 (1843).
Testudines (Hedrargloses), Wagler, Syst. 133 (1830).
Fornicati, Howorth, Phil. Mag. (1823).
Chelonia, Gray, Cat. Rept. R. M. 3.
Oppel, in his Ordinuagen, Familien u.Gattungen der Reptilien (1811), divides the Tortoises (Testudinat i) thus:—

M. Cuvier, Regne Animal, ii. 9 (1817), divides the Cheloniens or Testudo, Limu., thus:—

The same arrangement is followed in the Second Edition, ii. 8, and he has added the generic names which have been given by Fleming, Bell and others to his sections of Bronnian's genera.

Merrem, Tent. Syst. Amphib., (1820), divides the Testudinata thus:—

Dr. John Fleming, in the Philosophy of Zoology (1822), where he named many of the sections indicated by Cuvier in his Animal Kingdom, arranges the Chelonea thus:—

M. Latreille, in the Fam. Nat. du Regne Animal, 91 (1825), divides the Order Cheloniidæ thus:—

Dr. Gray, in the Annals of Philosophy for 1825, proposed the following arrangement:—
1. Feet and head retractile into the carapace. Carapace solid, covered with horny scales. Cryptopodæ.
11. Feet and head not or only partly retractile into the carapace. Carapace mostly soft. Gymnopolodiæ.

Mr. T. Bell, in his paper on the Characters of the Order, Families and Genera of the Testudinata (Zool. Journ. iii. 513, 1828), divides the Order thus:—

Dr. John Wagler, in the Naturliches System der Amphibien (1830), divides the Order Testudines (p. 133) thus:—

Dr. Gray, in the Synopsis Reptilinum, Part i. (1831), divides the Cheloniidæ thus:—

Wiegenmann and Ruthe, Handbuch der Zoologie (1832), divide the Order Cheloniidæ into families:—
M. Charles Bonaparte, in his *Système Generale d'Entomologie, 30* (1832), divides the Testudinata thus:—

Messrs. Duméril and Bibron (*Erg. Gén. ii. 1835*) divide the Tortoises or Cheloniens thus:—

M. Charles L. Bonaparte, in his *Tortola Analtica dei Cheloni* (1836), divides the Cheloni into three families:—

The following is the Specchio dei Generi e Sottogeneri:—

Dr. J. E. Gray (Ann. Nat. Hist. 1838, i. 275) proposed a new arrangement of Reptiles with short characters, thus:—

and he points out the analogies between this order and those of Mammalia and Birds.

Swainson, in *Lardner's Cabinet Cyclopaedia* (1839), p. 343, arranges these animals thus:—

Dr. Fitzinger (*Systeme Reptilium, p. 29, 1843*) divides the Testudinata thus:—

Order I. Tylopoda. Fam. I. Testudines. 1. Cinixys. 2. Chersia. 3. Testudo. Order II. Stegano- 

§ 1. Rostrata. Fam. I. Emyda. 1. Emys. 2. Cleawus. 3. Chelydra. 4. Sternotopys. 5. Cyno- 

nectes. Order III. Oiacopoda. Fam. I. Chelone. 1. Chelonia. 2. Thalassochelys. Fam. II. Dermato- 

chelys. 1. Dermatochelys.

F. I. C. Mayer (*System des Thierreichs, 189, 1849*; *Wiegmann's Arch. 1850, 67*) arranges the Tylopoda or Cheloniens thus:—

The upper shield or carapace is formed by the ribs (eight pairs), enlarged and united together and to the annular part of the dorsal vertebra by toothed sutures, so as to be immovable; the lower shield or plastron is formed of the pieces which represent the chest bone (usually nine), and a circle of bones analogous to the sternal cartilages of quadrupeds. The vertebrae of the neck and tail alone are movable. The two long envelopes are immediately covered with skin or scales, and surround the muscles of the extremity.—*Ann. Phil.* 1825.

The bones of the sternum are in general united together into a single plate, and are often affixed to the margin by a toothed suture, but in the *Cisrude* they are united to it by a cartilaginous band allowing of a slight motion; and sometimes, as in the *Box Tortoise*, the sternum is divided into two or three parts by one or two cross sutures, allowing the front or hinder lobe, or both, to move on the middle or fixed part. In the genus *Chelys*, and the families *Trionycide* and *Cheloniade*, the sternal bones form a ring, leaving a cartilaginous space in the centre.
Synopsis of the Families.

A. Digitata. Feet digitate.

1. Testudinidae. Feet club-shaped; claws 5-4 or 4-5, blunt. Caudal shields united into one, incurve. Neck retractile.

2. Emydidae. Feet palmed; claws 5-4 or 4-5, acute. Caudal shields separate. Neck retractile. Pelvis attached to the vertebrae only. Sternum shields 11 or 12.

b. Back with soft skin.

B. Pinnae.

A. Digitata. Feet digitate.

a. Leptonota. Back covered with hard horny scales. Toes digitate, 4- or 5-clawed.

* Tylopoda. Feet clavate.

Fam. I. Testudinidae (Land Tortoises).

Head ovate, shielded; jaws naked; nostril apical. Neck retractile into the cavity of the shell. Feet short, club-shaped, armed with blunt claws. Shell very solid, thick, ovate, the ribs united together to the margin, in the adult state covered with horny concentrically grooved shields, marked with a permanent areola; marginal plates 24 to 26, the caudal pair always united together into one broad generally incurved plate. Sternum broad and solid, closed in the centre of the adult, and firmly attached to the thorn by a bony suture, covered by the end of the pectoral and abdominal plates. Tail short and thick.

Testudinidae, Gray, Ann. Phil. x. 211 (1825); Syn. Rept. 8 (1831).

Testudinidae, Bell, Zool. Journ. ii. 419, 513 (1828).

Synopsis of the Genera.

1. Testudo, Linn.

Thorax convex, subglobose, solid. Sternum solid, covered with twelve sternal shields, the gular pair separate; pectoral shields narrow; inguinal shields moderate. Head scaly, with two frontal shields above, and one vertical shield between the eyes. Claws 5-4, blunt.

Testudo, sp., Linn.

They are slow in their motions, eating vegetables and
CATALOGUE OF SHIELD REPTILES.

roots; living in woods or fields in warm and temperate parts of the world. In colder climates they burrow, and sleep during the winter.

In the genus Testudo the sternum is quite solid, but in some specimens of T. mauritiana, T. marginata, and Homopus arcellatus, the hinder lobe has been observed to be moveable. On this account Dr. Wagler has separated the former into a genus, under the name of Cheesescus. But it may be only a peculiarity of the females when they are about to deposit their eggs, and will probably, when these animals have been more observed, be found common to the females of all the species.

A. The last vertebral shield almost always as wide as the caudal and two hinder marginal plates. American.

Gophers.

Shell oblong, depressed; shields pale brown, grooved; nuchal shield broad; sternum produced in front, deeply nicked behind; pectoral shields short; head and cheeks covered with scales; tail very short.

Gopher, Bartram's Travels, i. 55.

Sphargis mercureius, Schinz, t. 8, f. 1; not Merrem.

The Brazilian Tortoise, Gray, l. c. 5.

Hab. America; Brazil; Cayenne; Guadaloupe; Chili.

a, b, c. Adult (stuffed). South America.

e. Half-grown, with only seven marginal plates (stuffed). West Indies. Presented by John Gould, Esq.

f. g. Half-grown and young. South America.

h, i, j, k, l, m, o. Shell only (adult and young). South America.

p, q, r. Skeletons (half-grown). South America.

This species differs in appearance according to the state of the surface of the shell. When perfect the surface is black, with small yellow impressed areolas to the plates surrounded with deep concentric grooves; but the surface is often more or less worn, when the concentric furrows are destroyed, the surface becomes smooth, and the small areolas are obliterated. In this state it has been considered a distinct species. The hinder vertebral plate is large, as broad as the caudal, the hinder marginal and half of the second hinder marginal plate. In one specimen, which has only eleven marginal plates on each side (the two hinder being united?), the hinder vertebral is as wide as the caudal and half the large hinder marginal plates.
B. The last vertebral generally only as wide as the caudal and half of each of the hinder marginal shields.

Conflined to the Old World.

a. Indian.

3. Testudo Indica. The Indian Tortoise.

Black; pectoral shields short; nuchal plates variable or wanting; animal black; last vertebral often as broad as the last three marginal.

Testudo Indica, Gmelin, S. N.

Testudo (Megalochelys) gigantea, Fitz. Syst. Rept. 29.

Hob. Isle of France; Seychelles; Isle Angouan; India; California; Galapagos.

m. Adult (stuffed).

j. Adult animal and shell; 23 inches.

l. Half-grown (stuffed).

f. Young (stuffed); 7 inches. Nuchal plate none.

g. Young (stuffed); feet bad; 6 inches. Nuchal plate none.

i. Very young (stuffed); 4½ inches. Whitish; nuchal plate none; nucleus of plates dark.

d. Very young (stuffed); 4 inches. Nuchal plate distinct. Last vertebral narrower than the last three marginal.

Bengal. Presented by General J. Hardwicke.

Osteology. Cuvier, Oss. Foss. v. 176. t. 11. f. 17, 20, skull.

h. Upper shell only, very large and broad. Presented by E. Cross, Esq.

a. Adult (shell only); 32 inches. Nuchal plate; not a good state.

c. Adult; 21 inches. Nuchal plate distinct.

e. Young (shell only); 14 inches. Nuchal plate distinct.

h. Young (shell only); 5½ inches. Nuchal plate none; nucleus of marginal and gular plates pale.

b. Very young (only upper part of shell); 4 inches. No nuchal plate. Presented by J. E. Gray, Esq.

a. Skeleton; adult. India! Presented by Her Majesty.

o. Skeleton; half-grown. India. Mr. Bartlett's Collection.

p. Skeleton; half-grown.

q. Skull. India. Dr. Mantell's Collection.

Var. Elongate, compressed on the sides, and turned up at the edge.

Testudo Voisinei, Fitz.

s. Adult (stuffed). India? Presented by the Earl of Derby.

Testudo Indica.—The skull in the Museum Collection, and the one figured by Cuvier, t. 11. f. 17-20, have a very convex forehead.

4. Testudo planiceps. The Flat-headed Tortoise.

Tab. XXXIV.

Skull much depressed, flat; forehead flat, rapidly shelving towards the nose-cavity.

Hab. Galapagos?

This species is only known by the skull. The following are the descriptions and measurements of a skull of T. Indica and T. planiceps of nearly the same dimensions.

Testudo Indica.—Skull high, convex; forehead convex, rounded to the nose-cavity, broad between the eyes; temples flat behind; cheek small, four-sided; edge of the jaw between the nose-cavity and the mouth narrow and rounded. Nose-cavity oblong, nearly twice as high as broad, contracted on each side above. Palate broad, oblong, very deeply concave, and with concave converging sides in front. Sphenoid bone deeply concave beneath the condyle; lower jaws narrowed and rounded in front, not more than half as high as behind.

*Testudo planiceps.*—Skull much depressed, flat; forehead flat, with a rapid declivity towards the nose-cavity, narrow between the eyes; temples produced, bent in behind; cheeks large, subtrigonal; edge of the jaws between the nose-cavity and the mouth and erect. Nose-cavity nearly square, scarcely higher than broad, and very little contracted above. Palate narrow, nearly lozenge-shaped, truncated behind, rather deeply concave, with straight converging sides in front. Sphenoid bone flat beneath the condyle; lower jaw convex, erect in front and as high as behind.

After an examination of the specimens of the large Black Tortoise (*T. Indica*) in the various English and continental collections, including the specimens which had served Schweigger, Schlegel, Fitzinger, Duméril and Blyton, and others as the type of the species, in the Catalogue of the Tortoises, &c. in the Collection of the British Museum, I regarded them all as varieties of a single, very variable species, which had been scattered by man in different tropical parts of the globe. I see no cause to change this opinion with respect to the head above described and figured, even should it prove to be that of a black species, which is possible, as the black species is the only one known which has any affinity to it in point of size, and is said to be from a shell of that colour. This skull was sent to Haslar Hospital, and was said to have been taken from a specimen brought from the Galapagos Islands.

The Black Tortoise of those Islands has been described by Dr. Horsfield under the name of *Testudo Elephas*, but his figure and description so exactly agree with the adult *Testudo Indica*, and the specimen in the Gardens of the Zoological Society, brought from the Galapagos Islands, is so exactly similar to the specimens of *Testudo Indica* from the Mauritius, that I cannot think the usual black Galapagos Tortoise is different from that species, or like the skull here described under the name of *T. planiceps*.

Shell oblong, rather depressed, pale, varied with blackish, especially upon the lower side; the areola of the costal plates near their upper edge; the gular plates elongate, triangular, longer than broad; the anal plates broader than long, the hinder notch broad, triangular, the hinder marginal plates broad, with the nucleus on the centre of their margin; the front edge of the fore arms with smaller scales than the hinder; the vent with two blunt spines on each side.

*Testudo Horsfieldii* (Dr. Horsfield's Tortoise), *Gray, Cat. Rept. B.M. 7.*

*Hab.* India; Afghanistan.

*Young.* India; Afghanistan. Presented by the Hon. East India Company.

This species is very like *Testudo sulcata*, but the shell is more depressed, the margin rather more produced and toothed, and the scales of the fore feet are small and unequal, and those on the side of the vent are shorter and broader than in that species. The nuclei of the hinder marginal shields are central, while in *T. sulcata* they are on the hinder edge of the scales.

It resembles *T. groenich*, but the three pairs of sternal plates are longer in comparison to their width than any specimens we have, and the nuclei of all the hinder marginal plates are on the hinder edge, and not in the centre.

Shell ovate, convex; shields convex, grooved, black, yellow-rayed; areola large, placed near the hinder edge; nuchal shield none; head and feet black, yellow-spotted; tail short.

*Testudo stellata,* Schweigger, *Prod.* 1. 325.

   Testudo (Psammobates) geometrica, Fitz, Syst. Schildkr. 122.
   Cherms geometrica, Merrem.
   T. testudo, Daud. Rept. iii. 277. t. 25. f. 3.
   T. tentoria, Bell, Zool. Journ. iii. 120. t. 24; Test. t. 1.
   Hab. Africa; Cape of Good Hope; Madagascar.

Var. 1. Shell oblong, elongate, narrow; discale plate flat or concave; sternum flat or concave, brown, rare; nuchal plate elongate, narrow; caudal shield much incurved (T. geometrica).

Var. 2. tentoria. Shell oblong, ventricose; sternum convex, black-rayed; nuchal plates elongate, narrow; shields convex, truncated; caudal shield incurved, convex (T. tentoria, Bell).

Osteology:

c. Shell only, wanting a few plates; 5 inches. Vertebral shield very high. Cape of Good Hope.

Var. 3. nigribrunnea. Shell oblong, ventricose; sternum convex, dark in the middle, white on the sides; nuchal plates short, truncated; shields convex, often high, truncated.

a. Shell (half-grown). South Africa.

The specimen of Testudo luteola (Daud., Rept. i. 25) in the Paris Museum is evidently a young shell of this species, without any shields.

There is no difference in the colour or in the size of the areole of the three varieties; the nuchal shield of the variety tentoria is sometimes reduced to a linear transverse band; and is very rarely quite deficient.

Schlegel refers Testudo tentoria and Pyxis arenoides of Bell to this species (Fauna Japonica).

8. Testudo Verreauxii. Verreaux’s Tortoise.

Shell rather depressed, broad, brown, varied with broad, black and narrow, pale yellow rays and spots; beneath yellow, brown varied with a few black rays; marginal shields placed at an angle with respect to the costal shield; nuchal plate triangular; discale plates simple, convex; areola black, with four yellow rays. Head above yellow; feet with large imbricate scales in front.

Hab. South Africa.

a. Animal and shell. South Africa. From Mr. Warwick’s Collection.

This species chiefly differs from T. geometrica in being more depressed, brown, with black and narrow yellow rays.
9. Testudo semisserrata. The **Toothed Cape Tortoise**.

Brown, yellow-rayed; below yellow, black-rayed; nuchal shield elongate, triangular; anterior and posterior margin strongly serrated, the hinder margin recurved; discal shield with six or eight, marginal shield with one or two, broad black rays; the fore feet with large tubercular scales above the claws.

Gras, Cat. Rept. B.M. 8.
Dum. Cat. Meth. R. 3.

**Hab.** South Africa.

**Osteology:**

d. Young (shell only). Thorax orbicular; margin more acutely serrated. South Africa. From the South African Museum.

**10. Testudo radiata. The Coup.**

Shell hemispherical; shields flat, grooved, black, yellow-rayed, areola small, rufous; nuchal shield triangular; sternum produced in front, truncated behind.

Testudo radiata, Shaw, Zool. iii. t. 2.
Gen. Mus. t. 3. f. 2.

T. calcarata (part.), Merrem, Tent. f. 11.

**Hab.** Madagascar.

h. Adult (shell and animal). Margin and shields much worn. Gular plate produced, rounded, not nicked; anal plate very short, very convex. Madagascar.

l. Like h, but gular plate nicked.

m & n. Very young (animal and shell). Madagascar.

**Osteology.** Wagler, Syst. Amphib. t. 6. f. 1, 2, skeleton; Cuvier, Oss. Foss. v. 193. t. 12. f. 1, 6, 12, t. 13. f. 16, 17, 27, 28, 35.

e. Shell only, wanting some plates; 5½ inches. Madagascar.

f. Young (shell only); 4 inches. Gular plate short, truncated. Madagascar.

g & o. Young (shell only).

h. Very young (shell only).

i. Half-grown (shell only).

q. Shell only. Shield black, with very broad yellow rays. Madagascar.

11. Testudo Pardalis. The **Leopard Tortoise**.

Shell nearly hemispherical, blackish or yellow, black-spotted; shields grooved; areola of the costal shields near the upper edge; nuchal shields none.

Testudo Pardalis, Bell, Zool. Journ. ii. 420. t. 25; Test. t. 1, 2.

**Hab.** Africa; Cape of Good Hope; Port Natal.

d. Adult (animal and shell); 12½ inches. South Africa. From the South African Museum.

**Osteology:**

f. Adult (stuffed); discal shield convex; caudal shield produced, elongate. South Africa. From the Zoological Society.

g. Young (shell only, without front lobe of sternum); yellow, shields black-edged, areola spotted; shields grooved.

h. Sternum only; 13 inches. South Africa.

12. Testudo sulcata. The **Grooved Tortoise**.

Shell oblong, depressed, dirty-yellow, dorsal line flattened, with a deep triangular notch in front; front and hinder margin strongly reflexed and deeply toothed; lateral edge slightly keeled; caudal plate very broad, inflexed; shields deeply grooved, areola small, of costal and marginal plates marginal. Animal blackish-brown; scales over the eyebrows small; sternum produced and bifid in front. Animal pale yellow; feet with very large scales in front; thighs with two large spines.

Hab. Europe; North Africa; Greece.

Var. Shell very convex, black, yellow spotted; edge of shell very blant; dorsal shields angular, deeply grooved; tail very short, conical, blant. Body 1 foot; tail 1 inch.

Hab. Iberia, near Tiflis.—Eichw.

Males? Caudal plate broad, strongly inflexed, sometimes grooved.
d & e. Stuffed. Sternum black varied; caudal plate entire; 3 inches. South Europe.

Osteology:—
a. Shell only. Caudal plate entire; hinder lateral margin rather expanded. South Europe.

Females? and young. Caudal plate rather narrow, flat, sometimes divided.

t. Mauritania, Dum. & Bib. Erp. Gén. ii. 44.

k. Shell only; 2½ inches. South Europe. Presented by J. E. Gray, Esq.

Osteology:—
g. Shell only; 3⅛ inches. South Europe.
h. Shell only; 5 inches. South Europe. Presented by J. E. Gray, Esq.

Testudo Mauritania, Dum. & Bib. Erp. Gén. ii. 44.
a. Shell only (half-grown).

p. q. r. Shell only (young).
s & t. Skeleton and shell (adult and young).

These shells vary considerably in external appearance. In some the caudal plate is broader and strongly bent in at the tip; in others it is narrower and flat, or even sometimes slightly bent out at the tip. All the female and young specimens I have examined have this form; I therefore consider it as a sexual character only. The caudal plate in both of these variations is often divided by a more or less distinct central longitudinal groove, which has been considered as a specific character, but it varies greatly in distinctness in different specimens; in some the margins over the hind limbs are more produced and reflexed than
in others; these appear to pass almost into T. marginata.
This variety is figured by Schlegel, t. 9.

The hinder lobe of the sternum of the female is sometimes moveable.

Called Testudina at Rome, where they are sold in the market and eaten on fast days.

In the College of Surgeons there is a very narrow and high variety, with the caudal plate spread out, and the margin dilated and reflexed.

Schlegel refers T. marginata and T. Zolhafae as varieties of T. greelo.

Shell oblong, ventricose, hinder edge horizontally expanded; shields black, yellow-varied, grooved, areola small, yellow; nuchal plate slender, long; animal blackish; limbs largely sealed.

Osteology:—

Caret, Spix, Cephal. t. 4, f. 12, 15, skull.
a. Shell only (adult). The hinder margin very much produced. Greece. Mr. Parry's Collection.

It is doubtful if this is more than an accidental variety of T. greelo, for the hinder lateral margin of the shell of that species is often more or less produced.

What is Testudo Forstenii, from Gilolo,—Schlegel, Verhand.!

Schlegel, on the cover of Fauna Japonica, gives the name of Testudo marginifera to the figure of a Tortoise with hair from the base of a very high lump on its back.

2. Homopus.

Shell depressed, solid. Sternum solid; hinder lobe sometimes mobile; sternal shields 12, gular plates separate, pectoral plates narrowed on the inner edge. Claws 4·4, elongate, acute. Fore-legs covered with uniform large elongated scales. Sternum convex; gular plates short, separate. Africa.

Gray, Cat. Tort. B.M. 10 (1841).

Testudo Homopus, Fitz. Syst. Rept. 29 (1843).

Testudo Chersobius, Fitz. Syst. Schildk. 122 (1836).

Shell oblong, uniformly inclined on the sides; shield flatish, yellow, black-lined or dotted, areola blackish, sunk.

Testudo sculpta, Brandt, MSS, not Spix.

Hab. South Africa; Cape of Good Hope; Madagascar.

a. Adult (animal and shell; stuffed); worn. Pale horn-colour, with a brown spot in each areola; 3½ inches. South Africa. Presented by J. E. Gray, Esq.
c. Animal and shell (half-grown), in spirits. Cape of Good Hope. Mr. Brandt’s Collection.

Testudo sculpta, Brandt, MSS, not Spix.

f & g. Animal and shell (stuffed). South Africa.

Osteology:—

Apt to vary in the number and form of the vertebral, costal and marginal shields; the nuchal shield is sometimes wanting, or reduced to a small triangular scale behind the angles of the marginal plates.

Animal pale brown-black, strongly toothed; head with small scales and a large six-sided occipital plate; fore-leg with lanceolate tubercular scales; tail short, conical; cheeks covered with small scales.

Testudo cafra and Testudo jucuncella, Daudin, of which only two very imperfect specimens exist in the Paris Museum, are probably varieties of one of these species. The first has fifteen discaL and the latter very convex dorsal plates.

3. Chersina, Gray.

Thorax convex, very solid. Sternum solid; sternal shields 11, the gular pair united into a single produced one; inguinal plates moderate. Claws 5·4.

Palate of skull flat.

Testudo et Chersina, Fitz, Syst. Schildk. 122 (1836).

Chersina (Chersina), Fitz, Syst. Rept. 29 (1843).

Duméril and Bibron and Fitzinger have confounded this genus with the varieties of Testudo Indicus, which have the gular plates united or apparently so.

Palate of skull flat, very unlike that of true Testudines, where the palate is very deep, concave.

Thorax convex, hinder lobe becoming mobile, with a carious suture over the inguinal plate. Sternum solid; sternal plates 12; gular pair separate; inguinal plates very large. Claws 5·4 or 4·4, cylindrical, blunt; outer front one small.

Gray, Syg. 15 (1831); Cat. Tort. R.M. 11.

Kinixys, Wagler, Syst. 188 (1830).

Fitz, Syst. Rept. 29 (1843); Syst. Schildk. 121 (1846).

Cinothorax (Bellianus), Fitz, Syst. Rept. 29 (1843).

In the young the dorsal suture is scarcely observable, but then the genus can be distinguished by the large size of the inguinal plates; the suture becomes more observable.
as the animal increases in age, unlike the Box Tortoises, where the movable lobes of the sternum often become anchylosed in the older specimens. Cuvier, having seen only one specimen (Reg. Anim. ii. 10), considered this structure as an accidental deformity, and Wagler by mistake says it is the front part that is moveable.

In a very perfect young specimen in the Museum, the third costal shield is divided obliquely across by a regular linear suture into two distinct plates, from the hinder part of the upper to the front part of the lower or outer edge.

The number of the claws is liable to vary in the same specimen.

* Sternum truncated before and behind; fifth vertebral plate evenly convex; claws 4-4 or 5-4. Cnothorax.

1. *Kinixys Belliana.* Bell’s *Kinixys.* Tab. II.

Shell oblong, subquadrate, yellow, brown-rayed, rather depressed in front, margin nearly entire; fourth and fifth vertebral shields equally convex; nuchal shield elongated.

Kinixys Shoensis, Rüppell, Mus. Sench. t.

Hab. North and West Africa; (naturalized in Guadaloupe and Mexico?).

d. Very young (in spirits). The nuchal shield short, small, distinct, the third costal plate on each side divided regularly and obliquely across; the fore-leg with a row of triangular spines on the inner side, and two or three scattered irregular spines on its front part. Africa. Mr. Burdett’s Collection.

** Sternum deeply notched in front; claws 5-4; fifth vertebral plate regularly rounded. Cinixys.

Shell oblong, brown (yellow-rayed?), hinder edge reflexed, toothed; the fifth vertebral shield equally rounded; nuchal shield none.

Testudo angulata (adult), Schlegel, F. Japon. 72.

Kinixys castanea, Bell, Linn. Trans. xv. t. 18.

Kinixys castanea, Fitz. Syst. Rep. 29; Syst. Schildk. 121. Testudo Schöpfl, Fitz.

Young. Back equally rounded; fifth vertebral shields scarcely raised.

Kinixys castanea, Bell, Linn. Trans. xvii. t. 18.

Very young. Shell depressed, entire; edge toothed.

Testudo denticulata, Shaw, Zool. ii. t. 13, in Mus. Coll. Socy.

T. erosa, Schlegel.

Hab. West Africa; Gambia.

a. Adult shell (with fore feet only); 9½ inches. Fore feet covered with three rows of large, long, triangular scales.

West Africa; Gambia.

Osteology :—

b. Half-grown (shell only); 6 inches. West Africa. Presented by Thomas Bell, Esq.

Kinixys castanea, Bell, Linn. Trans. xv. t. 18.

c. Half-grown (shell only); 5 inches. West Africa?

*** Sternum slightly notched in front; claws 5-4; fifth vertebral plate produced.

Shell oblong, subquadrate, brown, hinder edge reflexed; upper edge of the fifth vertebral shield compressed, produced; nuchal shield generally distinct.

Kinixys Homeana, Bell, Linn. Trans. xvi. 400. t. 17 (1828). Gray, Syn. 13; Cat. Tort. B.M. 11.

Hab. West Africa; (naturalized in Demerara? and Guadaloupe?).

Osteology :—

b. Shell only. Cape Coast, West Africa. Presented by Lieut. Matthew C. Friend, R.N.

M. Schlegel (Fauna Japon. Cheloni. 72) regards both
K. castanea and K. Homeana as the adult state of Chersina angulata!

5. PYXIS.
Shell subglobose, solid. Sternum with the front lobe mobile, the suture below the humeral and pectoral shields.
Animal — ?

Emydidea, Fitz.
Fluviales seu Elodites, Dem. & Bib.

Fam. II. EMYDIDE (Terrapens).
Head rather depressed, covered with a hard or soft skin; jaws with a naked horny beak; nostril small, apical. Neck retractile into the cavity of the thorax. Feet depressed, expanded; toes 5, 5' or 4, 4, almost always webbed to the claws; claws sharp. Tail conical, shielded beneath. Thorax generally depressed, solid, with a distinct bony margin, covered with horny plates. Discal plates 13, marginal 24–26, caudal always separate; sternal shields 11 or 12, gular pair sometimes united. The vertebral of the neck bent in a perpendicular bow. Pelvis only united to the vertebrea. Rapid; living in freshwater ponds. Carnivorous, eating molluscs, worms, insects and carrious; only taking their food while in the water. Egg oblong, white.

CATALOGUE OF SHIELD REPTILES.

SYNOPSIS OF THE GENERA.

1. **Manouria.**
   - Head and tail moderate; sterno-costal suture simple.
   - Sternum solid, truncated before and nickered behind, attached to the thorax by a bony symphysis, covered with the edge of the pectoral and abdominal shields; sternal plates 12; axillary and inguinal plates moderate or wide.
   - Pectoral plates small, short, triangular, lateral, far apart.

2. **Geocemyda.**
   - Head covered with a thin hard skin. Toes rather short, free; claws 5-4.
   - **Pectoral plates broad, square, close together, side by side.**
   - Toes strong, free, not webbed; cross-shielded above.

3. **Nicoria.**
   - Head covered with a thin hard skin; eyes large, close together, subocular. Toes very short, united.

4. **Geocemyda.**
   - Head covered with a thin hard skin, rhombic; forehead flat; eyes lateral. Toes strong, shortly webbed.

5. **Emsys.**
   - Head covered with a thin hard skin, broad, ovate; forehead convex; eyes subocular; branches of lower jaw narrow, covered with the beak. Toes short, strongly webbed.

6. **Chrysemys.**
   - Head covered with a thin hard skin, oblong; forehead convex; eyes subocular. Sternum broad, rounded before and behind. Toes strongly webbed.

7. **Pseudemys.**
   - Head covered with a thin hard skin, ovate; forehead convex; eyes subocular; branches of lower jaw dilated, flat, covered with a soft skin. Toes short, webbed.

8. **Batagur.**
   - Head covered with a thin hard skin, broad, ovate; forehead convex; eyes subocular; branches of lower jaw narrow. Toes largely webbed.

9. **Malaclemys.**
   - Head depressed, covered with a soft skin, ovate; forehead convex; eyes subocular. Toes broadly webbed.

10. **Emydina.**
    - Sternum divided by a central cross suture, attached to the thorax by a limpoporous suture, covered by the end of the pectoral and abdominal shields; sternal plates 12; axillary and inguinal plates very small. Toes webbed.
    - **Legs scaly; toes slightly webbed.**

11. **Cistudo.**
    - Head rhombic; forehead flat; eyes lateral. Sternum very broad; anterior lobe covered with the gular, humeral and pectoral plates; and quite free.

12. **Latreillina.**
    - Head ovate; forehead convex; eyes subocular. Sternum broad; the suture between the two sternal lobes in the short sterno-costal suture.
    - **Legs with crescentic shields; toes broadly webbed.**

13. **Cyclemys.**
    - Head ovate; forehead convex; eyes subocular. Sternum rather narrower than the cavity at each end; the cross suture between the two sternal lobes in the middle of the long sterno-costal suture.

14. **Kinosternon.**
    - Sternum plates 11; gular plates united; humeral and pectoral distinct; pectoral triangular.

15. **Aromochelys.**
    - Sternum plates 11; gular linear, rudimentary; pectoral broad, four-sided.

16. **Staurotypus.**
    - Sternum plates 8; gular, humeral and pectoral united together.

17. **Chelester.**
    - Head depressed, covered with a soft skin. Shell with a single series of marginal shields.

18. **Macromeys.**
    - Head large, high, covered with symmetrically horned plates. Shell with a double series of marginal shields on each side.

19. **Platysternon.**
    - Tail cylindrical, shielded. Shell depressed.

20. **Dermatemys.**
    - Tail — ? Shell convex.

These genera pass gradually one into the other, and the similarity in the form of the sternum between *Platysternon* and *Emys* converts the series into a circle. The genus *Cistudo* appears to unite them to the Land Tortoises, while *Chelester* has some affinities with certain of the *Chelydra.*

A. **Head and tail moderate; sterno-costal suture simple.**

*Emydina* (part.); Gray, Ann. Phil. x. 210 (1825).

b. Sternum solid, truncated before and nickered behind, attached to the thorax by a bony symphysis; sternal plates 12; axillary and inguinal plates moderate or wide. *Emydina.*

*Fitz, Syst. Rept. 29 (1843).*

* Pectoral plates small, short, triangular, lateral, far apart.

1. **MANOURIA.**

Animal unknown. Shell rather depressed; caudal plates double, separate. Sternum solid, broad, produced and
slightly nicked in front, with only five pair of broad shields; the pectoral shields being short, subtriangular, only occupying the angle between the outer edge of the humeral and abdominal shields; axillary shields small, inguinal larger; the areola of the discal shield central.

The depressed form and divided caudal plate induce me to place this genus in Emysidae. It most resembles Testudo Gopher in appearance, but is at once known from that species and all the other genera of Testudinidae, Emyidae and Chelydidae by the peculiar form of the pectoral plates, which at first sight might be mistaken for a very large inguinal plate, if that plate were not also present. In this respect it somewhat resembles the genus Kinosternon, but there the plate is only narrow at the outer end and reaches nearly to the centre of the sternum.

The various genera of Testudinidae have the pectoral plates much smaller than the others, and perhaps the small size of the plate in this genus shows its affinity among the Emysidae to that family; and were it not for the regular division of the caudal and the form of the pectoral plates, it might be regarded as nearly allied to the very variable Testudo Species.

Pale brown, nearly uniform. Discal shield concentrically grooved, with a central areola; the anterior and posterior lateral margins acute, slightly sinuated and rather bent up; the humeral and abdominal plates longer than broad, the abdominal very large; gular produced, narrowed in front.

Hub. Pinang.

a. Shell only, in bad state, wanting many of the horny discal shields; front of the sternum acutely notched. Pinang. From the Zoological Society.

b. Shell only: adult. In a bad state; front of the sternum deformed and worn nearly round. Pinang Hills. From Dr. Cantor's Collection. Presented by the Hon. East India Company.

"Geoemyda spinosa, Cantor."

"Found on the great hill at Pinang at a distance from water."—Cantor.

Dr. Cantor's description of the animal is copied from the generic character of the genus Geoemyda in this Catalogue, and therefore has no special relation to the animal of this genus.

** Pectoral plates broad, square, close together, side by side. 

† Toes strong, free, not webbed, covered with a series of plates above.

2. Geoemyda.

Head covered with a thin hard skin, oblong; forehead rather convex. Eyes subocular. Branches of the lower jaw narrow, rounded, covered with the beak. Chin not bearded. Legs strong, not fringed behind, covered with large triangular scales. Toes short, free to the base, covered above by a series of shields; claws 3'-4', short, curved. Hind foot with a distinct rudimentary clawless fifth toe. Tail tapering. Shell depressed, keeled; areola of dorsal shields posterior, marginal; hinder edge strongly toothed. Sternum solid, broad, truncated before, nicked behind; shields six pair, subequal; pectoral shields broad; gular plate linear, band-like; small; axillary and inguinal plates small. The sternum is often concave, like Testudo.

This genus differs from Emys in the toes being quite free.

Shell oblong, subquadrate, keeled, flattened above, chestnut-brown, front and hinder edge strongly serrated; vertebral plates broad, first subbuccolate; costal plates with a posterior, subocular arcoila, with a slight subconic tubercle; beneath yellow, brown-rayed. Young depressed, pale brown, bluntly keeled, with a distinct spine in the areola of each discal plate.

Emys spinosa, Gray, Sys. 20; Illust. Ind. Zool. 1. f. 1 (young).

Bell, Test. t. 1, young.

"Geoemyda spinosa," Schlegel.

Testudo Emys, G. Müller, Verh. Rept. 34. t. 4 (?) (1844); (vertebral plates not keeled).

Hub. Pinang (Cantor); Sumatra (Müller); Java (Dumeril).

a. Adult (stuffed); 8 inches. Sumatra. River Auar.

"Testudo Emys, G. Müller."
CATALOGUE OF SHIELD REPTILES.

17. Cheeks The 3\textsuperscript{rd} series Back very shield 3. Half-grown 1. NICORIA. Adult axillary large animal Adult is hinder 103. Costal their end, hinder keels in areola. •ff rudimentary strongly foot narrowly, thick skin hard, truncate behind, nicked behind; shields six pair, subequal; pectoral shields broad, square; gular small; axillary and inguinal plates rudimentary or wanting. Africa.

3. NICORIA.

Head covered with a thin horny skin; forehead narrow. Eyes very large, rather close, subopercular. Upper beak very strong, acute. Legs strong, not fringed behind, covered with thick triangular scales, forming a series on the outer side of the front. Toes very short, united, free just at the end, covered above with broad-like shields. Hind foot narrow, with a very obscure rudiment of a fifth toe, only to be seen in the skeleton or in the dry contracted state. Claws 5 \& 4, curved. Shell depressed, three-keeled; areola of dorsal shield posterior, marginal; hinder edge strongly toothed. Sternum solid, broad, truncated before, nicked behind; shields six pair, subequal; pectoral shields broad, square; gular small; axillary and inguinal plates rudimentary or wanting. Africa.

Shell oblong, depressed, pale brown, three-keeled; keels continuous, distant, black-edged; hinder edge deeply serrated; vertebral shields quadrated; sternum black, yellow-edged. Animal alive, red dotted, with a white streak on each side of the neck.

Testudo Spengleri, \textit{Wallh. Berlin Naturf.} vi. 122. t. 3.

Emys Spengleri, \textit{Doed.} ii. 103.

Schweig. Prod. 310.

Meeveau, Ann. 23.

Testudo serrata, Shaw, \textit{Zool.} iii. 50. t. 9.

T. serpentina, var., \textit{Linn.} R. 163.

Hab. Africa! China.

Osteology:—

b. Half-grown shell; the ossification incomplete on the entire circumference. Africa.

Schlegel, in the \textit{Fauna Japonica}, confounds \textit{Emys crus-sicollis}, \textit{E. Thurgi}, \textit{E. Reevesii} and \textit{Cistudo dentata} with this species, but they do not even belong to the same natural genus. It appears to be rare on the Continent, as it is wanting in the Paris and Leyden Museums.

Latreille and Prince Bonaparte confounded this species with \textit{Chelonura serpentina}.

4. GEOCLEMYS.

Head moderate, covered with a thin hard skin; forehead flat; cheeks perpendicular. Eyes lateral. Chin not bearded. Fore-legs covered with broad hulne scales. Toes short, strong, covered with transverse shields above, slightly webbed. Claws 5 \& 4. Tail moderate. Shell depressed. Sternum solid, broad, truncated before, nicked behind; affixed to the thorax by a bony symphysis, covered by the sides of the pectoral and abdominal plates; axillary and inguinal plates moderate, distinct. Asiatic and American.

Emys, sp., \textit{Brongniart} and others.

This genus contains the more terrestrial and solid-shelled Terrapins with webbed feet; their head is more square and flat-topped than in their more aquatic congeners; and they have the eyes on the side of the face. The skull is square, with a broad flat forehead; the orbits being placed quite on the side of the head and not interrupting the outline of the forehead, as in the more aquatic \textit{Emys}.

These animals are essentially aquatic, but often leave the water for months together. They are very active and restless.

* Back three-keeled; keels interrupted, nodose.

** Back three-keeled; keels continued.

*** Back one-keeled; shields radiate, concentrically grooved.

**** Back not keeled, depressed; shields thin, spotted.

* Back three-keeled, spotted; areola rugose, each with a very broad nodous longitudinal ridge; hinder edge entire or subdeterminate. Asiatic.

1. GEOCLEMYS Hamiltonii. Hamilton's Emys.

Shell oblong, convex, solid, with three interrupted keels, slightly toothed behind, black, yellow-rayed; shield convex, areola rugose, with a large irregular central keel;
sternum keeled on the sides, black, yellow-varied. Head and body black, yellow-spotted.

Emys Hamiltonii, Gray, Syn. 21: 72; Cat. Tort. B.M. 19.

E. guttata, B. Hamilton, MSS.

Gray, Illust. Ind. Zool. t. 9, f. 1, not Schweig.
E. Picquotii, Lesson, Belanger, Voy. 294.

Hub. India; Bengal. Common in ponds.

a. Animal (in spirit). India; Bengal. From M. Picquot’s Collection.
b. Animal (stuffed). India; Bengal. From M. Picquot’s Collection.

The head is rhombic; the forehead flat, rather convex over the eyebrows.

** Back three-keeled; keels continued. Asiatic.

2. Geoclemys Reevesii. Reeves’ Emys. Tab. V.

Shell oblong, very convex, black (pale brown when dead), obscurely three-keeled; keels distant, lateral and continued; vertebral shields broad, six-sided; margin cutire; the second pair of sternal shields subtriangular, narrow at the inner edge; inguinal and axillary plates large. Head black, check and neck yellow-lined.

Emys Reevesii, Gray, Syn. Rept. 73.

Hub. China.

Osteology:—

M. Schlegel also refers this most distinct species to Geoclemys Spengleri. It is much like E. Hamiltonii in general appearance, but differs in the keel being continued.

Head rhombic; crown flat, when dry rather convex over the orbits, smooth, brown, with a few pale dots; checks with a short broad white line from the middle of the hinder edge of the orbits. Tympanum edged with a white lunate band above; eyes lateral; lower back pale, brown-varied, with a broad short pale streak from its hinder edge. Toes short. The first vertebral plate broad, only slightly contracted behind.

The second specimen (Tab. V.) has the same marks, but they have been rather distorted in the stuffing.

Shell ovate, convex, brown, entire, three-keeled; keels continuous, yellow, lateral ones arched; vertebral shield broad; marginal plates very broad; sternum flat, keeled on the sides, brown, with a pale streak on each side. Head red spotted and streaked; feet brown; toes scarcely webbed.

Emys trisulca’, Kerlant, Prod. F. Zeylon. 177.

Hub. Ceylon.

a. Young, in spirit. Ceylon. Mr. Cumings’s Collection.

Shell brown, with three pale keels; marginal shield with a linear marginal spot; under side black, with a broad white edge on each side of the sternum, and a narrow line in front. Head black, with symmetrical pale spots on the crown, face and chin; a large round white spot behind the hinder angle of the eyelids, commencing a broad, more or less interrupted streak on the upper part of the side of the neck. Feet and legs black, with a few small white specks on the front of the legs.

*** Back one-keeled; shields radiately and concentrically grooved. North America.

Shell oblong, depressed, keeled in front, hinder edge slightly reflexed; shields radiately and concentrically grooved, minutely yellow and black dotted, areola small; nuchal slender; sternum yellow, areola posterior, marginal, black. Animal chestnut-brown.

SYNOPSIS OF SECTIONS.

* Back three-keeled; vertebral plates elongate, subtrigonal. Asiatic.

** Back three-keeled; vertebral plates broad, square. Asiatic.

*** Back more or less one-keeled, often becoming keelless. Old and New Worlds.

* Back three-keeled; vertebral plates elongate, subtrigonal; areola of discal shields with a narrow longitudinal ridge; hinder edge subdentate or entire. Asiatic.

Shell ovate, oblong, rather convex, black, slightly three-keeled; keels close; vertebral plates elongate, six-sided; sides revolute, hinder edge serrated; sternum flat, pale, and keeled on the sides. Head and neck thick, black.

E. Spengleri, var., Schlegel, F. Japon. 51.

Hab. Sumatra and Pinang (Cantor, Cat. 3); Batavia, Java (Quoy); Borneo (Schlegel).

b. Animal and shell (half-grown; in spirits). Sumatra.

From the Leyden Museum.

c. Adult (stuffed). Keels on sides of sternum yellow. India.

d. Adult (stuffed). Sternum uniform black. India.

e. Half-grown (in spirits). Shell brown, having a bronzed appearance; vertebral plates distorted. Head brown, with a white spot over and rather before each eye, on the side of the chin, and on each side of the nape, surrounding the back edge of the tympanum, and indistinctly continued across the throat; a small white streak on the middle of the black tympanum. Sumatra. Mr. Bartlett's Collection.

OSTEOLoGY:—

a. Shell only: 4 1/2 inches long. Sumatra. Presented by Thomas Bell, Esq.

f. Adult shell (very old). Ceylon. Presented by Dr. Kelhart.

Fore legs with large, irregular, transverse plates on the inner side of the front, and a row of large, triangular, compressed, keeled scales on the outer. Toes short, strong, with a series of band-like scales above; webs scaly. Hind legs granular, with a few large scales on the outer, and small close ones on the inner margin.

"They are numerous in Pinang, inhabiting rivulets and ponds in the valleys. The throat is whitish, and a small white spot appears on each side of the occiput; the vertebral keels and the lateral spines become obliterated with age. It feeds on frogs, and also upon shell-fish and animal offal, and is often taken by the angler with the hook."—Cantor.

M. Schlegel could never have observed Nacoria Spengleri, or he would not have confounded it with this species.

** Back three-keeled; vertebral plates broad, square. Asiatic.

2. Emys triguga. The Three-keeled Emys. Tab. IV.

Shell convex, oval, brown, three-keeled; keels rather interrupted; margin slightly toothed; shields rugose, areola margined, posterior, rugose; first vertebral plate five-sided, keeled, rather narrower behind; others six-sided, rather longer than broad; sternum rather convex on the sides, blackish. Head brown, with a yellow streak over each eye; beaks yellow-varied.

Hab. India; Pondicherry; Malabar; Bengal; ponds at Calcutta.

OSTEOLoGY. Tab. XXXVII. f. 2, skulls.

c. Adult skeleton. Margin of shell revolute. Head narrow, rather small (a female?). From the Leyden Collection.

"Emys subtrijuga, Mus. Leyden."

b. Adult skeleton. Under side of margin and edge of sternum black; dorsal keels yellow; margin of shell not revolute. Head broad, large; forehead rather convex, (a male?). India. From the Vienna Museum.

Skull depressed; forehead flat, rather convex over the orbits; sides of the face slightly shelving; cheeks and temples rather convex; orbits large, slightly intruding on the outline of the forehead.

3. Emys nigricans. The Blackish Emys. Tab. VI.

Shell ovate, oblong, rather convex, revolute on the sides and slightly toothed behind, brown, slightly three-keeled, the central keel prominent, blunt, interrupted in front and continued behind, the lateral keels far apart, indistinct
and interrupted; shield radially striated, blackish-rayed; areola of vertebral plates posterior, marginal, of costal plates superior, submarginal; nuchal plate none; margin yellow-spotted beneath; sternum convex, rounded on the side; axillary plate moderate, inguinal large. Animal black; neck with three or four yellow lines on the side; chin and throat yellow, black-varied.

Hab. China.

c. Adult (stuffed). China! From the Zoological Society.

a. Young animal (dry, from spirits); 2\frac{3}{4} inches long. China; Canton. Presented by the Hon. East India Company. From Dr. Cantor’s Collection.

Osteology:

b. Shell and head (dry), margin broken; 2\frac{1}{2} inches. China. Presented by J. R. Reeves, Esq.

Dr. Cantor’s specimens of E. mutica only differ from the larger specimen in the Museum in the plates being worn.

Head of the dry specimen uniform brown, showing no appearance of any pale marks. Forehead rather convex. Eyes subsuperior.

The head covered with a thin skin; neck granular; the fore legs with two series of broad band-like shields on the inner and a series of narrower larger shields on the outer side. Toes covered with scales with a broad web, and with three or four band-like scales above near the claws. Claws black, curved; the hinder stronger. Allied to the genus Batagur.

Shell ovate, convex, slightly three-keeled, olive, black-speckled; shields smooth, with a central orange streak; vertebral shields broad, six-sided, first narrowest, as long as broad; areola of vertebral plates posterior, marginal, of costal subcentral, subposterior; margin entire, rather revolute in front, and expanded over the leg behind, beneath yellow, with an oval, rather posterior, black-edged olive spot; sternum high, slightly keeled on the sides. Head and neck olive, with yellow narrow lines.

Hab. China; Canton.

a. Adult (stuffed); 4 inches long. China. Presented by John Reeves, Esq.

Toes broadly webbed. Head elongate; forehead rather convex; eyes subsuperior.

*** Back more or less one-keeled, often becoming keelless; areola of costal plates simple; hinder edge entire or nearly so.

† Asiatic.

5. Emys Thurgii. The Thurgii.

Shell oblong, rather convex, olive-brown; margin yellowish, rather toothed behind; vertebral plates, first square, broader behind, second and third broad, six-sided; sternum olive, slightly keeled on the sides. Head olive, with a broad yellow band from the nostrils, over the eyebrows, along the side of the neck; feet olive, yellow-spotted.

Emys flavo-nigra, Lesson, Bull. Soc. xxi. 12, and Belanger, Voy. 22.

Hab. India, Bengal; Pinang (Cantor).

a. Adult (stuffed); 13 inches. Blackish-brown; under side of marginal plate yellow-edged. India, Bengal. From M. Picquet’s Collection.

b. Young (dry); 5 inches. Shell keeled; the hinder edge of the second and third vertebral plates submarginal; the middle of the vertebral and the upper part of the lateral costal shields and the hinder costal shield blackish; the marginal shields pale-edged. India, Bengal.

M. Schlegel also refers this species, which he has not seen, to Geoemyda Spengleri. It has not the slightest affinity to it, and is ten times the size!

The head ovate; forehead rather convex; eyes rather close together, subsuperior; front of legs with broad lunate scales. Toes broadly webbed.

Shell ovate, oblong, solid, rather convex, olive, black-dotted; back slightly contracted and keeled behind, hinder edge rather expanded, entire; vertebral shields transverse, six-sided; sternum rather paler, black-spotted and lined. Head yellowish, black-spotted; chin and cheek yellow-marked; occiput with two large eye spots; neck scarlet-lined, with three broader distant streaks on the upper side.

Hab. China (Reeve).
CATALOGUE OF SHIELD REPTILES.

42. Young E. 

Head moderate; forehead nearly flat; eyes sublateral. The fore legs with a single series of very broad lunate thin scales. Toes broadly webbed; claws narrow, elongate.

7. Emys Bennetti. BENNETT'S EMYS. Tab. X.

Shell oblong, rather convex, bluntly and subglobularly keeled, expanded and entire behind; shields dark horn-colour, concentrically grooved, with a broad blackish edge; the vertebral shields as broad as long; first squarish, five-sided, convex; second, third and fourth six-sided, blunt, keeled on the hinder half; fifth rounded in front, three-sided behind, nuchal plate oblong; beneath yellow, with the middle of the sternal plates, all but the edge of the axillary and inguinal plates, and a very large spot rather nearer the hinder edge of the marginal shields, black. Animal olive. Head with symmetrical, narrow, dark-edged, curved lines on the crown; temples with several narrow dark-edged longitudinal streaks; neck with numerous narrow yellow lines. Legs yellow-lined.

Hab. China!

b. Adult (stuffed). Plate worn and discoloured from having been kept in confinement. China! From the Gardens of the Zoological Society.

Revised by J. Reeves, Esq.

The younger specimen is like E. Caspica, but more depressed and paler above, and the areolas of the costal plates are rather more central.

†† European or North African.

9. Emys Caspica. THE CASPIAN EMYS.

Shell ovate, oblong, depressed, olive, with black-edged yellow netted lines; shields flat, vertebral broad, six-sided; sternum flat, black and yellow varied. Head, neck and feet yellow-lined.

Testudo Grecia, Pallis, Z. R. A. iii. 17.

Hab. Border of Caspian Sea; Morea; Isle of Crete; Sicily; Algiers; Spain.

c. Adult (stuffed); 6½ inches. South Europe.

g. Adult (stuffed). Shell all black; edge of nuchal shield elongate. From the Zoological Society's Gardens.

b. i. Young (in spirits). Back with three interrupted keels, formed by a dark-edged, pale, oblong tubercle on the centre of the areola of the costal shields; sternum black, pale-edged; beak, temple and neck white-lined, with a round white spot over the middle of the tympanum. North Africa. Mr. Fraser's Collection.

Emys Pontonica, Michahelles.
CATALOGUE OF SHIELD REPTILES.

1. Young (in spirits). Upper margin with a large pale ring, and lower with two black spots on each ring. Banks of the Euphrates.

2. Young (in spirits). Marginal plates with a subcentral black-edged pale band above, and a large square sutural spot beneath, sometimes separated into a twin spot divided at the suture. Xanthus. Presented by Sir Charles Fellows.

Osteology:

a. Adult shell; 4½ inches. Shell and sternum pale, worn. Europe. Presented by Thomas Bell, Esq.

b. Adult skeletons and shell. Claws all elongate; sternum black. Mr. Alexander's Collection.

c. Young shell, with three nodulous keels; sternum black; 2½ inches. South America. Presented by Dr. J. E. Gray.

Griffith, A. K. t. f.

The sternum becomes pale and worn when the animal is kept in confinement. The front of the fore legs with several series of broad lunate scales on the inner side, and two series of large ovate elongate convex scales on the outer edge. Skull depressed, broad; forehead flat; nose truncated; cheeks nearly perpendicular; orbits nearly entirely lateral; lower jaw narrow.

There is perhaps more than one species combined under this name, or the pattern of the marks on the young is subject to considerable variation, which can only be decided by the study of more specimens than we at present possess.

Mr. Bell observes that the Testudo Europaea is a species of Terrapene; if so, the name of it should be changed, as it is certainly the Emys of the ancients.—Gray, Ann. Phil. 1825.

+++ African.

Tab. IX.

Shell pale olive, yellowish beneath; sides rounded; hinder lateral margin rather expanded and recurved; hinder end rather compressed above; plates thin, transparent, inferior plates with a narrow black edge. Head large, short, broad, covered with a smooth skin; fore legs and neck with very narrow yellow lines when alive.

Hab. West Africa; Gambia.

a, b, c, d, e. Adult. West Africa. Mr. Castany's Collection.

Eyes sublateral, near end of nose. Feet broadly webbed. The front of the large legs with two series of broad square scales on the inner, and two or three series of larger, more oblong scales on the outer edge.

Somewhat like E. olivacea, but the shell is more convex; and the vertebrae, as seen through the plates, are considerably wider.

What is Emys Bonensis, Schlegel, in Müller, Verhand.?

Shell (very young) hemispherical, strongly toothed behind; shields elevated, furrowed, granulated, grooved, each two connected longitudinally by a largish round black spot, and horizontally by a largish black circle, consequently each displaying two half-eyes, and anteriorly and posteriorly two half-spots; margin with a spot on each suture, the points of which correspond with the spot on the costal shield; sternum yellow, with dark brown spots and streaks.

Emys oculifera, Gray, Syg. 22; Cat. Tort. B.M. 28. Testudo oculifera, Kuhl, Beitr. 77.

+++ North American.

Several of the American Terrapenes have the claws of the front feet much elongated, especially the three central ones; but this does not appear to be a permanent character; for it is found in some specimens, and not in others of the same species.

It may be observed, that the North American species of this genus require to be revised and accurately compared, as their present descriptions and the figures which have hitherto been published of them are often very unsatisfactory.

* The dorsal shields variegated or ringed; the marginal shields with two half rings, the centre being on the suture.

† The dorsal (vertebral and costal) shields with a single concentric set of rings or spots on each.

‡‡ The costal shield with a subcentral, transverse, pale streak, surrounded with irregular dark lines.

§§ The costal shield with a single, subcentral, forked, pale, transverse, irregular streak.

** The dorsal shields variegated or ringed; the marginal shield with a single spot or ring, with the centre on its hinder edge.

*** Dark uniform.
The dorsal shields variegated or ringed; the marginal shields with two half rings, the centre of the ring being on the suture.

The system of colouring is most distinct in the young shell; and as the animal grows, the position of the centres of the concentric rings or spots is considerably altered; thus the spot which is central in the very young animal becomes more and more lateral as regards the shield it is under, as the animal increases in size. To define a species properly, it should be examined, compared, and described in all its stages of growth, which has as yet been the case with very few of the American Emys.

There are sometimes one and sometimes two centres of the spots or concentric rings under each of the dorsal shields; but, in general, the centres of the spots in the margin are placed on or near the suture between two marginal shields, so that a part of the same spots or set of rings is on two neighbouring shields.

The colouring matter which forms the spots or variegations on the shell, is situated in the skin under the shields. The marks are much more defined and regular in the young animal, and more distinct in the skin when the shields are removed, than when seen through the thicker shields of the older animal. The colouring matter appears to be much influenced by the health of the animal; for specimens which are well marked often become less marked and almost uniformly coloured in confinement, rendering the distinction of specimens of shells which have died in confinement very difficult; and in many cases the sternal shields themselves become thinner, and at length carious, which at once shows that the shell is in a diseased state, and should not be considered in its normal state of colouring.

§ The dorsal (vertebral and costal) shields with a single spot or concentric series of rings on each. Sternum yellow, with a large, irregular, but defined dark blotch on the central line.

12. Emys ornata. The Beautiful Emys. Tab. XII.

Shell oblong, longitudinally rugose, olive; vertebral shields irregularly ringed; first four-sided, second and third rather long, six-sided; costal shields with black-edged pale rings round a brown spot rather below the centre; marginal shield with concentric pale rings round a posterior sutural spot; beneath yellow, with round ringed spots on the suture of the marginal plates, and with a dark-edged, irregular, greenish line down the centre of the sternum, and a double one the whole length of the sterno-costal symphysis.

Head, neck and beak with broad and narrow yellow streaks.

Emys ornata, Bell, MSS.

Gray, Sys. 30; Cat. Tort. R.M. 22; Beechey, Voy. 1. Dorn. & Bib. Exp. Gén. ii. 286 (not Synop.).

Hub. N.W. coast of America; New Orleans, Mexico, Tampa, Yucatan.

j. Adult (stuffed). America. From the Zoological Society's Gardens. Tab. XII.

l. Adult (stuffed). Costal shields longitudinally furrowed; dark-coloured rings indistinct. Mexico.

m. Adult (stuffed). America. From the Zoological Society.

h. Young (stuffed). Plates radially striated. Mexico?

d & e. Very young (in spirits). Ancell of vertebral plates with a posterior central spot and lateral streak; costal with a central spot rather below the centre, surrounded with three or four regular rings; marginal plates with a spot on hinder margin, and rings in front of it. Head yellow-lined, with two broader lines on side of head. Mazatlán. Presented by Alexander Collie, Esq., R.N.

e & n. Very young (dry). Mexico.

Osteology:

b. Adult (shell only). Tropical America. Presented by Dr. J. E. Gray.

Tab. XII. a.

Shell oblong, longitudinally subrugose, olive; vertebral plates with irregular-shaped, concentric, pale rings, the costal with more regular, concentric, pale rings round a brown spot, which is rather above the centre; marginal shield with concentric rings round a posterior sutural spot. Beneath yellow, with round dark spots on the suture of the marginal spots, and darker-edged, irregular, greenish lines on the central and other sutures of the plates, and a double line on the sterno-costal symphysis. Head, neck and beak with broad and narrow yellow streaks.

Hub. Southern States of America; Honduras (Dusza).
a. Adult (stuffed). Shields smooth, polished; dark rings well marked. America.

b. Adult (stuffed). Back very dark blackish-brown; shields rugose; rings and sternal bands indistinct from mechanism. Mexico. Mr. Warwick’s Collection.

**Osteology:**

b. Adult (shell only). Shields rather smooth; dark spots very distinct.

c. Half-grown (shell only). Shields nearly smooth; sternal bands distinct.

d. Adult (shell only). Shields rather furrowed; sternal bands distinct.

This species chiefly differs from *E. ornata* in the rings on the shields being more regular, and in the dark spot of the nucleus of the shield being higher up in the costal shields. The sternal bands are generally more or less obliterated in the specimens which have been in confinement.

Tab. XII. b.

Shell oblong, very similar in markings to *E. ornata* and *E. venusta*, but the pale rings are narrower, fewer, and in the anterior costal the outer one extends from the upper to the lower outer margin, and the pale rings on the marginal plates are narrower. The head and neck have crowded, narrow, yellow lines, forming symmetrical rings on the throat. Sternum yellow, nearly covered with dark-edged, concentric, irregular bands. Beak with beautiful symmetrical spots, surrounded with concentric black lines.

*Hab.* America.

Tab. XXV. fig. 12.

Shell (very young) oblong, broad, rather convex, convexly keeled, smooth; pale brown (when dry), with a round, pale-eyed, dark, subcentral spot, and a curved, dark-edged, pale band below, and a more indistinct one above the spot on each of the costal plates. Vertebral shield broad, six-sided. Sternum yellow, with a broad, irregular-edged, black, central, longitudinal band, varied with yellow in front, and with a broad black streak on each side near the end of the sternal plates; margins black-dotted beneath, with a large black ring on the middle of each plate. Head brown above, with three narrow pale streaks, one on the centre, and the others over each orbit; the upper part of the neck with seven longitudinal streaks, edged with a series of minute black dots; sides of neck, throat and feet minutely black-dotted, forming tortuous pale lines on the front of the legs.

*Hab.* Mexico.

§§ The costal shield with a subcentral, transverse, pale streak, with more or less irregular, parallel, dark oblong rings on each side. Sternum spotted.

The front dark lines in the first or anterior costal sometimes unite, forming spots, which are symmetrical on the two sides of the animal; the first, second and third vertebral shields have an arched pale band, with parallel darker streaks; and the fourth and fifth vertebral have an arched longitudinal band on each side, with parallel or concentric darker bands on each side of it. These bands are only to be distinctly observed in young well-marked specimens.

Tab. XV. fig. 1.

Shell oblong, rather convex, scarcely keeled, longitudinally rugose, pale, each shield with two oblong concentric rings, those of the vertebral plates longitudinal, of all the costal transverse; marginal plates each occupied with two semiorate spots, formed of concentric rings. Sternum yellow, with a large black spot on each shield, and with two large oblong spots of irregular concentric rings along each sterno-costal suture; nuchal plate elongate; first vertebral square, rather longer than broad, others wide, six-sided. The head, beak and neck are yellow-lined; temple with a large, broad, oblong streak from the back of the orbit along the sides of the neck.

*Emys Holbrooki,* Gray, Cat. Tort. B.M. 23.

*Hab.* North America; Cumberland River; Louisiana.

E. serrata, Brandt.

E. serrata, Miss. Leyden.

e. Young (in spirits). Sternal spots annular, distinct only where the plate is deficient. New Orleans.

f. Very young (in spirits). Sternal spots annular, brown, with a double marginal dark ring on the edge of the gular and the middle of the other plates.

Emys sauginoleuca, Gray, MS. T. Nat. XV. fig. 1.
Emys Kuhlii, Gray, Syn. Test. 73; Cat. Tort. B.M. 28.

OSTEOLOGY:

Emys Holbrooki, Gray, Cat. Tort. B.M. 23.

This species is very like E. scripta, but there is a distinct pale streak on the fourth or hinder costal shield, as well as on the others, while in E. scripta there is only a single dark spot on the hinder margin of that plate, surrounded with a single series of arched, dark, concentric lines; the form of the streaks on the neck and the extension of the dark marks on the sterno-costal symphysis are also permanent distinctions.

17. Emys scripta. The Lettered Emys.

Shell oblong, longitudinally rugose, keeled, toothed behind, brown, irregularly yellow-ringed, and with irregular yellow streaks on the sides, forming two oblong rings on the first, second, third and fourth costal plate, and concentric rings round a posterior dark spot on the front costal shield; muchal shield linear, porrect; vertebral shields bluntly keeled, first ureudate, fourth and fifth six-sided; under margia with a black spot on the back edge of each plate. Sternum yellowish, black-spotted, with a spot on each end of the sterno-costal symphysis. Head, neck and feet yellow-lined, the central frontal line distinct; the temple with a large pale spot.

Emys scripta, Merrem, Test. 24.

Gray, Syn. 29; Cat. Tort. B.M. 23.

Testudo scripta, Schreiger. Test. 16. t. 3. f. 4. 5. Shaw, Zool. t. 12.

Schreiger. Test. t. 3. f. 5.

Emys serrata, Schreiger, Prod. 301.

Merrem, Test. 26.

Holbrook, N. A. Herpet. i. 49. t. 5; i. 31. t. 5.

Testudo rugosa, var., Shaw, Zool. iii. 29.

A large species; shell often 12 or 14 inches long.

Var. 1. Temple with a large square yellow spot at the back of the orbit. Sternum pale, with a solid spot on each gular, axillary, inguinal and marginal shield.

E. scripta.

Var. 2. Temple with a large square spot at the back of the orbit. Sternum pale, with regular subcentral black rings on each sternal plate.

Var. 3. Temple with a large, broad, erect streak behind the eye, and a large triangular spot over the tympanum. Sternum pale, with a round solid spot on each gular, axillary, inguinal and marginal plate.

Var. 4. Temple with a large, broad, oblong streak from the back of the orbit along side of neck. Sternum with a large solid spot on most of the sternal and on each marginal, axillary and inguinal plate.

a. Adult (stuffed). Three middle front claws moderate, broken; sternum with a solid black spot on each gular, axillary, inguinal and marginal plate, and on one or two of the other sternal plates.

b. Adult (stuffed). Three middle front claws moderate, broken; sternum with a solid black spot on each gular, axillary, inguinal and marginal plate, and on one or two of the other sternal plates.

Var. 5. Head and neck streaks very indistinct. Sternum black speckled, with a large irregular spot on each
shield, three on each abdominal plate (when the horny shields are removed, only concentric rings are seen).

a. Adult animal and shell (in spirits). North America; Cumberland River. From the Leyden Museum.

The indistinctness of the streak on this animal and marks on the shell may arise from the muddiness of the river, for the specimen was covered in several places with a coat of mud. The peculiar disposition of the colouring is to be seen when the shields of the back are removed from the skin. It may not be E. Troostii of Holbrook, which is said to be a very depressed species. See No. 23.

Shell oval, gibbous, longitudinally rugose, slightly carinated and entire behind, dark brown, with irregular yellow lines; nuchal shield triangular, beneath yellow, with a half black spot on each edge of the marginal plate above and below; jaws toothless; first vertebral urceolate, second and third hexagonal; plates olive, with several irregular black streaks, longitudinal on the vertebral and transverse on the costal plates. Sternum yellow. Head and neck dark olive, with two pale streaks for each eye, and two on each side of the neck below, the upper one with a branch to the eyes; the inferior pair united together in front of the throat with a single streak to the chin.

Holbrook, N. A. Herpet. ii. 47. t. 8; ed. 2. i. 65. t. 8.

Testudo floridana, Lew. C. Am. Age, N. Y. ii. 100.

Hab. North America; East Florida; St. John's River.

A large species, with the shell often 15 or 16 inches in length; it seems to take the place of E. scripta in Florida.

Shell (very young) oblong, with three series of oblong irregular rings on the vertebral plate; a broad subcentral and some narrower pale lines on each costal plate, as in E. scripta and E. maculata. Sternum pale, with some oblong brown spots on the suture of the shield, and a round spot on the centre of each pectoral shield. Head pale-lined, as in E. scripta, but without the broad spot or nuchal band of that species.

Emys annulifera, Gray, Syn. rept. 32; Cat. Tort. B.M. 28.

Hab. — ?

a. Very young (in spirits).

$$ Three spots or sets of rings on each of the costal plates? leaving a forked pale cross streak.

20. Emys rivulata. The Varied Emys. Tab. XI.

Shell oblong, brown, varied with yellow, with a broad central depression; sides longitudinally rugose, hinder edge rather expanded, simply serrated; nuchal plate elongate; first vertebral plate urceolate; second and third elongate, six-sided, the costal plates with a subcentral, forked or branched, horizontal, yellow band; under side white, varied with irregular dusky clouds, forming obscure rings on the marginal plates.

Emys rivulata, Gray, Cat. Tort. B.M. 22.

Hab. North America.

a. Shell only; 9 ½ inches long. North America?

I describe this species with doubt, as I have only seen a single shell in its adult state without the animal.

The second and third costal plates with an indistinct areola in the higher part of the hinder edge, with two diverging streaks to the outer margin. The marginal plates divided by a broad central pale streak, sometimes with an obscure indication of a pale lunule.

Species with natural marginal spot, requiring further examination.

Shell ovate, gibbous, not keeled, entire, longitudinally rugose, dusky brown; costal shield with an equal subsuperior ring, giving out diverging, sometimes anastomosing pale lines; marginal plate with a central transverse pale streak. Sternum yellow, with a spot on the symphysis and on some of the sides of the margin. Head and neck dark brown, with narrow yellow lines; throat dusky yellow, with three yellow streaks; a streak from the nostril extended on the side of the neck.

Testudo reticularia, Lator. rept. i. 124.

Emys reticularia, Merevf. Tast. 29.

Holbrook, N. A. Herpet. ii. 41; ed. 2. i. 59. t. 7.

*Hab.* North America, on the coast between North Carolina and Georgia. The flesh is much esteemed.

The shell is about 9 or 10 inches long.

**23. Emys Mobilensis. The Mobile Terrapen.**

"Shell oval, ciliate, convex anteriorly, depressed posteriorly, entire in front, emarginate and sub serrate behind; jaws serrated, inferior furnished with a hook." Length 15 inches.

*Emys Mobilensis,* Holbrook, N. A. Herpet. ed. 2. i. 71. t. 9.

*Hab.* North America (Alabama). Greatly esteemed at Mobile as an article of food.

The figures greatly resemble my *E. ventricosa*, but the margin is represented as having sutiural spots, which is not the case with that animal. See No. 25.

**23. Emys Troostii. Dr. Troost's Terrapen.**

"Shell subtruncated, much depressed, ciliate; posterior part of the margin very slightly serrate; lateral and marginal plates marked with blotches or lines of horn-colour. Sternum broad, dirty yellow, each plate with a large blotch near its centre. Head long, narrow; upper jaw emarginate, lower jaw furnished with a tooth."

*Emys Troostii,* Holbrook, N. A. Herpet. i. 123. t. 20.

*Hab.* N. America (Cumberland River).

Length of shell 8 inches.

I have received an indistinctly marked specimen (evidently from its having lived in a muddy river) of *E. scripta*, from the Leyden Museum, under the above name, and it is said to come from the Cumberland River! The mark on the shell was only to be seen when the horny plates were removed.

Can this be the shell intended in the above description?

**24. Emys labyrinthica. The Netted Terrapen.**

Shell oval, regular; hinder edge rather sinuous and elevated; central line swollen, not keeled, rugose, green, more or less brown, with a great number of sinuous and twisted yellow lines. Sternum entire in front, nicked behind, yellow. Head rather large; head and neck yellow streaked; lower jaw toothed.

*Hab.* North America (Wabash River).

What is *Emys elegans*, Wied, Voy. Amér. Septent. iii. 255, from North America?

**Dorsal shields variegated or ringed; the marginal shield with a single spot or ring, with the centre on its hinder margin. The costal shields with a single pale ring, surrounding the dark areola, giving out pale streaks from its circumference, diverging (sometimes anastomosing or crossing each other) towards the margin of the plate.**

§ The areola and ring on the hinder upper angle of the first or front, and the front (?) upper angle of the other costal plates; vertebral plate —— ?

**25. Emys ventricosa. The Swollen Terrapen.**

Tab. XIV.

Animal —— ? Shell convex, ventricose, swollen on the sides of the back, slightly keeled in front, and more sharply so behind; margin toothed behind; the hinder lateral margin bent up over the legs. Back rugose, blackish-brown, with some indistinct dark-edged yellow lines diverging from a squarish ring in the upper angle of the costal shields; upper side of the marginal plates with some dark rings concentrically round the hinder outer margin. The first vertebral areola, about as broad as long; the second, third and fourth elongate, six-sided. Sternum convex, pale yellow, with a narrow dark edge to the plates.

? *Emys Mobilensis,* Holbrook, N. Amer. Herpet. i. 71. t. 9; ii. 53. t. 9.

Gray, Cat. Tert. B. M. 25?

*Hab.* Cat. Mél. R. 11?

*Hab.* —— ?

a. Adult (shell only).

The sternum may in the perfect specimen be more distinctly marked, as this example had evidently died in confinement, as proved by the carious state of the centre of the sternum. The colour is very much suffused in the hinder part, almost hiding the pattern of the paler marks, and the central dorsal shields are rubbed and worn, hiding the pattern in that part of the shell. The swollen form,
the obscure rounded keel on the first, and the sharp keel on the two hinder vertebral keels, are very peculiar, and the manner in which the rings are marked on the marginal plates is unlike any of the other American Emys I have seen, except E. pseudogeographica and geographica.

The figure of Emys Mobileensis (Holbrook, N. A. Herpet. i. t. 9) somewhat represents this species, as far as regards the distribution of the colours of the costal shields (they are more definite than in our specimen), but the pattern on the upper and under sides of the marginal shield is entirely unlike, as the rings or spots are represented as being on the suture, half the spots being on each shield, as in the more common form of American Emys. But in this respect, Dr. Holbrook's artist is not to be depended on, as he represents Emys geographica distinctly, and pseudogeographica indistinctly, as having the rings of the same form, which authentic specimens show to be an error.

Dr. Holbrook represents the head, neck, throat and feet of Emys Mobileensis as having broad yellow lines, the two central throat lines being united near the chin.

§§ The dark areola and ring are in the upper hinder margin of the first, and gradually lower in the second and third, so as to be in the lower hinder margin of the fourth or last costal shield, and on the hinder margin of all the vertebral plates.

There is generally a smaller dark spot in the centre of the other rings, formed by the netted lines, as on the front lower edge of the first and second costal, and on the sides of the vertebral plates.

Shell ovate, convex, smooth, tubercularly keeled in front and slightly toothed behind, olive-brown, with black-edged anastomosing pale lines; first and fifth vertebral plates broad, five-sided, rest broad, six-sided. Sternum yellow; shields blackish-edged; under side of the marginal plates olive, with rather concentric, black-edged, broad and narrow pale lines. Head and feet with numerous yellow lines, and a triangular yellow streak on each temple.

E. Lesueurii, Gray, Syn. Rept. 31.

Emys megacephala, Holbrook, N. A. Herpet. i. 51. t. 3.

Hab. North America; New York; Wabash River; Cumberland River; Tennessee (Treaty).

Emys Lesueurii, Gray, Syn. Rept. 31.

The Museum specimen is in a bad state; it chiefly differs from E. pseudogeographica in the keel not being nodose, the vertebral plates very broad and short, and in the pale reticulations being finer.

It may be distinct from the E. geographica or megacephala of Holbrook (which is represented by the same figures); and perhaps it would have been better to retain for it the name under which I first described it.

Dr. Holbrook represents the head of E. geographica as large (that may be sexual), with numerous regular green lines, an oblong elongated spot on each side of the nape, and an eyed spot on each side of the throat, near the angle of the mouth.

Shell elongate-ovate, nicked in front, toothed behind; vertebral keel tubercular, very distinct, netted with numerous yellow lines, with a ring surrounding a dark spot on the hinder edge of the costal and marginal shields, and three smaller spots on the vertebral plates. Sternum yellow, darker clouded, darkest in the young. Head small, oval, brown, with numerous yellow lines and a yellow spot on and across each temple.

Emys, Lesueur, Mem. Mus. xv. 267 (1827).

Holbrook, N. A. Herpet. i. 103. t. 15 (1842).

E. geographica, var., Gray, Cat. Tort. B. M.

Hab. North America; Wabash River.

E. geographica a, Gray, Cat. Tort. B. M.
CATALOGUE OF SHIELD REPTILES.

E. geographica b, Gray, Cat. Tort. B.M.

e & d. Adult (stuffed). Frontal, temporal and labial streaks distinct, like "a." North America; Louisiana. Mr. W. Smith's Collection.

c. Adult (large size). Frontal, temporal and labial streaks narrow, with other parallel narrower lines, somewhat similar to "c." North America; Louisiana. Mr. W. Smith's Collection.

f & g. (Half-grown). Back very high, compressed and shelving, sharply keeled; frontal and temporal streaks distinct, moderate; labial narrow, interrupted. North America; Louisiana. Mr. W. Smith's Collection.

Head olive, with a more or less broad yellow streak on the centre of the crown, and a converging streak over each side of the occiput, arising from a broad angilar spot on the temple at the back of the orbit. Neck yellow-streaked. There are generally some narrow yellow streaks on the crown and occiput, parallel or concentric with the principal lines above described, and a curved yellow line on the upper lip under the orbit, but in one specimen (b) the upper lip is varied with dots and minute yellow curved lines.

The figure of Dr. Holbrook does not represent the dark spots of the areola which are so distinct in the stuffed specimen, and the markings on the marginal plates are very inaccurate.

*** Shell and margin uniformly coloured. Sternum variegated.

Shell depressed, broad, oblong; plates very thin, smooth, transparent; hinder part of the back bluntly keeled; vertebral plates broad, six-sided; margin revolute, raised and expanded over the hinder legs. Beneath ——? Sternum yellow, with dark-edged variegations on the central line, and sinuated, subconcentric, dark-edged bands on the front part. Head small, olive; forehead flat; nose very short; lower beak with several pale cross bands in front. Neck and legs yellowish olive; fore-legs with one or two broad pale streaks; three middle claws of fore feet very long, straight, subulate.

Hab. N. America?

a. Adult (stuffed). Obtained alive from a dealer at Nantes, who said it was from the South of Europe?

b. Tropical or South America.

† Back uniform coloured; margins and sternum often variegated; submarginal rings sutured when present.

Shell oblong, bluntly keeled, hinder edge slightly toothed; dorsal shields rugulose, irregularly radiately grooved, uniform pale brown, beneath yellowish, with obscure subocellate spots on the axillary, inguinal, and on the suture of the marginal plates. Animal greenish; check and throat indistinctly pale lined; front of the fore legs with a series of broad transverse shields.

Emys decussata, Bell, Test. t. 1.

Testudo serrata, Dum. Rept. (not figure).

Emys serrata, var., Schweig.

Schlegel, Fawc. Japan. 58.

Hab. West Indies; Cuba; Guadaloupe; St. Domingo.

Osteology. Skull, Tab. XXXVI. fig. 2.

b. Half-grown shell, from animal in confinement. America; West Indies.

e. Adult (skeleton). Sternum and lower side of marginal plates with dark rings. West Indies. Presented by Dr. J. E. Gray.

d. Adult (shell only). Sternum discoloured. West Indies?

c. Adult (shell only). Sternum and lower side of marginal shield with irregular rings; some indistinct large oblong sutured spots on the upper part of the marginal plates. West Indies.

g. Adult (shell only). Sternum discoloured and eroded. West Indies. From the Zoological Society's Gardens.

h. Half-grown (shell only). Back dark; sternum much eroded. West Indies. Presented by Thomas Bell, Esq.

Emys decussata, Bell.

i. Adult (skeleton). The upper part of the marginal shield with very indistinct, and lower part more distinct, square annulated sutured spots; sternum with distinct irregular...
lar-shaped symmetrical rings. St. Domingo. From the Paris Collection.

m. Adult (shell). Back dark brown; upper part of the margin with obscure, lower with very distinct oblong spots on the suture of the plates; sternum with irregular-shaped symmetrical rings and scattered black spots. West Indies. Presented by Dr. J. E. Gray.

The heads of both the skeletons are large, and the space between the branches of the lower jaw is wide and rounded in front, very unlike the small head and the narrower and more acute space between the branches of the lower jaw in E. rugosa.

The animal and shell are well figured from life by Mr. Bell. The head, neck and feet are blackish olive, the fore legs alone having some obscure indications of broad yellow streaks, but the animal may have been in confinement. The under surface of the marginal plate has some indistinct sutural rings.

M. R. de Sagra (Cuba Rept. t. 1) evidently figures the same species as the Hicotee.

++ Back uniform or black spotted; sternal and lower side of marginal plates dark-edged, sometimes spotted.

Shell ovate, oblong, rather tubercularly keeled, hinder edge slightly serrated; sternum brown, sometimes dark-spotted; shield dark-edged; shields rugulose, areola indistinct, margin dark-edged; vertebral shields: first long, urceolate; second, third and fourth long, six-sided; fifth broad, six-sided; marginal shields yellow, black-dotted.

“Animal brown; head and nape greyish, with a pale streak from the back of each eye.” —Sagra.

Emys rugosa, Gray, Syn. 30; Cat. Tort. B. M. 24.
Sagra, Cuba Rept. t. 2.
Testudo rugosa, Storr, Zool. iii. 28. t. 4.
Hab. West Indies; Cuba; Jamaica.

Var. 1. Back mottled and lined; sternal shield one-coloured, with a distinct dark edge.

Emys rugosa, Sagra.

Var. 2. Back spotted or with a few scattered round spots; the dorsal, marginal and sternal shields with a regular dark brown edge.

Emys rugosa, Gosse, J. 189.

Osteology:—

Var. 3. Back brown, closely black-dotted; sternum and under side of margin very closely spotted; sternal shields dark-edged.

Emys vermiculata, Gray, Cat. Tort. B. M. 25.

d. Shell only (adult). West Indies?

M. R. de Sagra (Rept. Cuba, t. 2) represents the head as having a pale central frontal streak and a broad pale band from the hinder edge of the orbit.

The shell is vermiculated with black above, and with regular dark edges to the sternal shields and the lower side of the marginal shields.

The head is much smaller than in E. rugosa, and the branches of the lower jaw are not so wide apart or so much rounded in front.

+++ Shell one-coloured; sternum black, yellow on the sides and margin; lower margin variegated.

Shell oblong, convex, brown, slightly keeled, flattish above, and shelving on the sides; shields blackish-edged; nuchal very short; vertebral keeled, the first produced in front between the marginal plates. Head blackish, with an orange spot on each nostril, a band over each eyebrow, and a large spot on each side of the nape; tail short.

Emys scabra, Gray, Syn. 25; Cat. Tort. B. M. 20.

Schlegf. Prod. i. 297-125.
Testudo punctularia, Daud. Rept. ii. 549.
Schlegf. Prod. 305.
Gray, Syn. 25, 13.
Rhinochlemys (punctularia), Fitz.

Hab. Tropical America; Cayenne; Brazil.

Larep. Q. O. t. 10.
b. c. Young (in spirits). Upper part of the marginal plates with short black vermiculated lines; the lower side yellow, with fewer tortuous similar lines on both sides of the body.

In our adult and three young specimens there is a spot on each side of the nose, a streak commencing from the middle of the orbit, diverging to the sides of the nape, a spot on each side of the middle of that part, and a narrow streak on the temple from the upper and lower part of the back edge of the orbit, and the neck is marked with several narrow black lines on the sides.

Mr. Bell’s figure of the adult (Testudinata, t. 1) differs from these in representing the superciliary bands as being united by a short transverse band in front.

32. Emys D’Orbignii. D’Orbigny’s Emys.

Shell ovate, swollen, nearly smooth, keelless, slightly toothed behind, chestnut-brown, with a black dorsal streak and large triangular black spots on the edge of the disk; first vertebral shield pear-shaped; marginal plates brown, with a large central yellow marginal spot. Sternum black, irregularly edged with yellow. Head and neck yellow-lined, with a broader streak from the back edge of the eyes along the sides of the neck; legs with broad yellow streaks; toes webbed; claws acute; crown with numerous yellow streaks; upper jaw nicked.

Emys D’Orbignii, Dnr. & Bib. Erp. Gén. p. 272; Cat. Mém. t. 11.

Tab. XIV. a.

Shell oblong, convex, rather elongate, keelless, slightly toothed behind, dark brown; shield smooth, slightly grooved, and rather paler on the edge; first vertebral four-sided, the second, third and fourth six-sided, about as long as broad. Sternum blackish, with a broad pale band on each side, and on the edge of the anterior and posterior shields; crown and cheeks black, with a broad pale streak from the nostril over the orbit and on the sides of the occiput, a broad sinusous streak from the upper part of the back edge of the orbit and another more sinusous beneath it.

Lips and throat yellow. Legs and feet yellow, black spotted and streaked.

Emys dorsalis, Spix, Bras. t. 9. f. 1, 2.

Hab. New Granada; River Buonaventura. J.O. Goodridge, Esq.

Emys dorsalis (Spix, Test. Bras. 11. t. 9. f. 1, 2) probably represents the young of this species, as the marks on the head agree with those on our specimen. This figure has been referred to E. scabra, but the form of the head bands, if they are correctly figured, at once separates it from that species.

6. CHRYSEMYS.

Head covered with a thin hard skin, oblong; forehead rather convex. Eyes subaqueor. Beak naked; upper with two small teeth in front; lower beak extended behind, covering the rounded lower edge of the lower jaw. Fore legs covered with large transverse shields. Toes short, strong, slightly webbed, covered with band-like scales above. Claws 5-4, compressed, arched, the three middle front often much elongated, subequal. Tail moderate. Shell depressed. Sternum solid, broad, truncated before and behind, affixed to the thorax by a bony symphysis covered at the end by the pectoral and abdominal shields; axillary and inguinal plates moderate, distinct. Shield very thin, smooth; the marginal plates with a subcentral marginal areola, surrounded with dark-edged concentric rings; the humeral plate triangular; the pectoral narrow, square.

Shell oblong, depressed, keelless, very smooth; shields thin, olive-brown; discal shield with a broad yellow or red front margin; vertebral shield with a narrow central line; sternum yellow. Head and throat black, yellow-lined; tail long, slender.

Cyclemys picta, Wagner, Syst. 137.

Hab. North America, in ponds (never in running water), from Canada to Virginia.

Var. 1. Pale-edged, the front of the discal plates broad; the lateral angle of the second, third and fourth vertebral plates anterior; the marginal plates with a yellow central spot and a broad concentric ring above, and a large yellow spot beneath.

g & h. Adult (stuffed). Three middle claws of front feet very long, slender. North America.

i. Adult (in spirits). Claws moderate, strong, curved; sternum with angular spots on inner edge, some having a pale eyd spot in the centre. New York. Mr. Brandt's Collection.

OSTELOGY:

e. Adult (upper shell only). North America. From Dr. Mantell's Collection.

Var. 2. The yellow edge to the discal plates narrow, uniform; the outer angles of the vertebral plates in the middle of the margin; the marginal plates with a small central marginal spot and two or three interrupted pale rings above, a large spot and a pale ring with a broad black edge beneath.

l. Adult shell. Sternum with a large central dark blotch, pale lined and dotted.

These Tortoises may be seen in great numbers in ponds, basking in the sun on rocks or logs, plunging instantaneously into the water on the approach of any one. They die in a very few days after being taken from the water. The young are more brilliantly coloured than the older ones.—Lecanite.

Wagler regards Emys maraworata, Spix, Br. t. 10, as this species, instead of E. vulgari.—Syst. 137.

Shell oblong, solid, rather depressed in the centre, convex on the sides, olive, waved with irregular black-edged pale-dotted greenish lines placed on the edge and across the middle of each shield; vertebrals nearly square, first urceolate, the rest six-sided; margin beneath black, yellow-dotted; sternum flat, surrounded with an irregular yellow edge; front edge deeply denticulate.

Emys Bellii, Gray, Syst. 31.; Cat. Tort. B.M. 27.

E. speciosa, W. Clift, Cat. Mus. Coll. Sety. no. 1525 (not Gray).

Holbrook, Amer. Herpet. ii. t. 1; ed. 2. i. 107. t. 16.

Gray, Cat. Tort. B.M. 23.

M. Bibron observes, that he has seen several specimens of this species in the "different London Museums;" the only one that has occurred to me is the one above described.

Dr. Holbrook's figure of Emys Origenensis (t. 21), in the dentated margin, and in the colouring of the sternum, greatly resembles this species, but the back is rather differently coloured, and the sternum is truncated behind. It is probably only an accidental variety.

+++ Toes slender, elongate, covered with small scales or nearly naked, very largely webbed; claws conical, scarcely curved.

7. PSEUDEMYS.

Head moderate, covered with a thin hard skin, ovate; forehead convex. Eyes subapertur. Chin flat, not bearded; branches of the lower jaw dilated, flat, covered with a soft thin skin. Fore legs covered with band-like scales. Toes slender, rather elongate, covered with scales, or with a smooth skin, widely webbed to the end of the toes. Claws 5-1, acute, rather compressed, straight or slightly curved. Tail moderate. Shell rather depressed. Sternum solid, truncated before, nickered behind, affixed to the thorax by a bony symphysis, covered by the end of the pectoral and abdominal shields; axillary and inguinal plates moderate, distinct.
CATALOGUE OF SHIELD REPTILES.

This genus is chiefly distinguished from *Emys* by the flattened under jaw and the small size of the lower beak, the under jaw being chiefly covered with a soft skin, and by the slenderness of the toes and the breadth of the web, which most resembles that of the genus *Batagur*.

The annulated spot on the under surface of the marginal plate on all the species I have examined is on the suture, so as to occupy a portion of two neighbouring shields.

*Jaws entire; upper only slightly nicked in front.*

Vertebral plates with three longitudinal, oblong, annulated spots, sometimes interrupted, each part forming an eyed spot; the costal plates with two or three annulated spots, the larger and principal one on the hinder margin sending out pale diverging tortuous lines which separate the spots and transversely divide the shield into halves.

1. *Pseudemys concinna.* The neat *Emys.*

Shell oblong, smooth, keelless, olive-brown, pale ringed and lined, with a pale streak across each costal shield, with several unequal-sized more or less oblong annulated spots on each shield; margin with a pale central cross-band above, with an oblong sutural spot beneath; sternum yellow, clouded with black, especially near the suture of the plates. Head olive; neck and feet yellow-lined, with a broad lateral streak from the back of each eye. Fore legs with two yellow streaks; webs with a triangular yellow spot on the margin between each claw.

*Holbrook, N. A. Herp.* ed. 2. i. 119. t. 19.

a. Adult (stuffed). Back keelless; costal with a square ring in the upper hinder angle of the first and second, which is rather lower down on the third plate, and with many curved lines subconcentric in front and below them. North America. From the Zoological Society.

b. Young. Back slightly keeled behind; the rings on the vertebral and costal plates well marked; the principal annulated spot on the hinder margin is on the upper part of the first and the lower of the third plate. Sternum pale yellowish, edges of the plates darker clouded. North America, Louisiana. Mr. Smith's Collection.

*Emys concinna,* Holbrook, N. Amer. Herp. t. 19.

c. Adult (stuffed). North America, Louisiana. Mr. Smith's Collection.

Shell oval, depressed, keelless, smooth, entire in front, elongated and imperfectly serrated behind; sternum oblong, nicked behind, dingy yellow, sides olive varied. Head very small, upper jaw slightly emarginate, lower jaw with a tooth; first vertebral truncate; each costal shield with four or five, and each marginal with dark spots with concentric yellow lines.

A large species; the shell of the adult about 12 inches long.

I am induced to refer this Tortoise, which I have not seen, to this genus, from the disposition of the colours, which resembles that of the preceding species.

*Jaws with two strong teeth above and three below in front.*

Costal shield with a double subcentral cross band, containing an oblong ringed spot in the upper part of the first, the middle of the second, and the lower part of the third costal plate.

3. *Pseudemys serrata.* The *Potter.*

Shell oblong, longitudinally rugose, slightly toothed behind; olive-brown, varied with irregular pale cross bands;
vertebral shields bluntly keeled; first urceolate, rest long, sides shelving, beneath yellow, with slightly eyed spots on the sutures of the marginal plates; sternum flat, darker clouded, with a dark-edged pale streak on the sutures, between the outer sides of the sternal and marginal plates. Head and neck with two broad streaks; jaws strongly toothed.

Holb. North America; in running water with rocky beds. “Between the Delaware River and Chesapeake Bay, Sold in the Philadelphia markets as the Potter or Red-headed Terrapen. The flesh is not greatly esteemed.”—Holbrook.

8. BATAGUR.
Head moderate, covered with a thin skin; chin not bearded. Feet largely webbed. Toes 3-3; the outer on each foot often clawless. Claws conical. Tail moderate. Shell oval, rounded, depressed. Sternum solid, broadly truncated before, nicked behind, affixed to the thorax by a bony symphysis, covered with the end of the pectoral and abdominal plates. Axillary and inguinal plates large. End of cavity contracted. Skull. T. Ann. XXXVI. fig. 4.

a. Young animal (stuffed); the second and third vertebral shields strongly keeled, ending in a tubercle behind; the fourth and fifth sharply keeled. Nepaul. Capt. Boys’ Collection. Tab. XVII.
CATALOGUE OF SHIELD REPTILES.

Osteology:—

b. Shell of half-grown. Vertebral plates obscurely keeled; sides not quite ossified. Tanks and nullahs near Saharanpoor. Presented by Dr. Falconer.

d. Very young (plate only the size of the areola); second and third vertebral plates nodose; hinder margin of shell subdentate. India. Capt. Boys’ Collection.

Like B. Baska, but differs in the number and size of the claws, and also in the shell becoming entirely solidified when only half the size.

3. Batagur Dhongoka. The Dhongoka. Tab. XVIII.

Olive, with three black streaks; vertebral plates keeled; first, second and fourth urceolate, longer than broad; third as broad as long; sternum deeply notched behind; gular plate triangular; the anal plates rather shorter than broad.

Gray, Cat. Tort. B.M. 17.
E. tectum, var. Schlegel, F. Japon. 51.

Gray, Cat. Tort. B.M. 15.

Hab. India; Nepal.

a. Young (stuffed). Olive, with three black streaks, and sides of the back darker; vertebral plates keeled; the second and third tubercular on the hinder edge. India; Ganges at Sultanpoor, near Benares. Tab. XVIII.

Bélandier, Voy. 29.

Hab. India; Bengal.

a, b, c. Adult (stuffed). India. From M. Piquot’s Collection.

d. Adult (in spirits). India.

e. Adult (stuffed). India. Presented by Dr. J. E. Gray.

Legs covered with broad thin shields in front, fringed on the outer side; the toes with a series of small, narrow, six-sided shields on the middle of the upper surface.

Schlegel regards E. lineata, E. Batagur, E. Dhongoka.
and *E. Kachuga* as varieties of this species, an opinion for which he has no ground, as he says he has not seen any of them.

Shell ovate oblong, olive, with a blackish keel; back rather angularly compressed; shields slightly rugose; the first vertebral one four-sided, as broad as long, the rest elongated, six-sided, keeled, the keel (of the third especially) produced behind into a tuberecle; margin dentated behind; the marginal and sternal plates yellow-keeled; sternum slightly elevated, and keeled on the sides, blackish, with yellow margins and edges to the plates. Head and neck brown, darker dotted and clouded.

*Testudo Dura,* *B. Hamilton,* Icon. indel. t. 21, fig. 188.

*Hab. India; Deccan; Mysore.*

a. Adult (stuffed); 6 inches. The third vertebral shield almost as broad as long; sternum low. Deccan. Presented by Colonel Sykes.

b. Half-grown (stuffed). Olive; hinder part of the foot, and the strong keel of the second and third vertebral shields, and a small spot on the middle of the hinder edge of the costal shields, blackish; the second and third vertebral shields broader than long, areola posterior; sternum high.

This species differs from *B. tecta* in the keel of the discal plates being blackish, not red, with black edges, and in the sternum not being spotted.

9. **MALACLEMYS.**

Head very large, depressed; crown flat; temples and nape covered with a soft spongy skin. Beak exposed; lower beak large, convex beneath. Chin not bearded. Legs short. Fore legs with very thin reticulated scales. Toes rather short, strong, covered with a few very thin shields, united by a broad, nearly naked web to the claws. Claws 5 • 4, subequal, curved, sharp. Tail conical. Shell depressed, oblong. Sternum solid, truncated before, nicked behind, affixed by a bony symphysis; axillary and inguinal plates distinct; discal and marginal plates with a subcentral areola surrounded by concentric rings or series of spots.

*Emys* § *Gray,* *Ann. Phil.* x. 1825, 211.

1. **Malaclemys concentrica.** Salt-water Terrapin.

Shell oval, rather convex, slightly tubercularly keeled; shields (and the bone under them) pale yellow, marked with brown concentric rings, which are often impressed.

Animal grey, black-spotted and lined.

Salt-water Terrapin, *Leconte,* *Southern States N. Amer.*

*Hab. North America, in salt-water marshes, from New York to Florida; and West Indies.*

*Var. concentrica.* Head black-lined; limbs black-spotted; shield smooth; dorsal and sternal shields with well-defined dark rings.

*Var. 2.* Head black-speckled; shield more or less deeply concentrically grooved, with dark rings. Sternum and lower side of marginal plates with dark rings.

g. Adult (shell only). North America.

*Var. 3.* concentrica. Head black-speckled; shield more or less deeply concentrically dark-grooved. Sternum and lower part of marginal plates black-dotted and clouded.

*Testudo centurata,* *Lath.*

e. Adult (in spirits). North America.

f. Adult animal (dry; not good state). Back obtusely and intermittently keeled; dorsal shield rugose, dark brown; sternum brown, with dark edge to the shields. North America. From the Zoological Society.

Var. 4. tuberculifera. The three central vertebral plates with a central tubercle, the hinder tubercle orbicular.

b. Shell only (young). California. Mr. J. Drummond's Collection.

Malaclemys tuberculifera, Gray, Cat. Tort. B.M.

Var. 5. areolata. Head small; back elevated.

Hub. Central America; Peten (Morelet).

Osteology:—

f. Shell only. North America.

Skull oblong; forehead convex, shelving towards the temples; orbits large, rather close together, shelving upwards, enabling the animal to see above it.

Mr. Bell, in his Testudinata, beautifully figures several specimens from life, showing the variations in the colouring of the animal. The animal varies in intensity from pale grey to blackish, and the spots on the temples, nape, neck, limbs and tail vary in size and depth, and are sometimes joined together into lines, which are often symmetrical on the two sides of the head.

"As an article of food it is much preferred to any other species, particularly when dug out of the marshes in a torpid state: immense numbers are annually brought to market. The males are small, and have the concentric stria more deeply impressed than the females."—Le Conte.

The very young specimens are about two inches long, pale brown; shields with narrow concentric lines; second, third, and front half of the fourth vertebral plate with a very broad rounded keel. Sternum brown-dotted; plates pale-edged, with a line of spots on the front and hinder edge. Mus. Bell.

A very young specimen in spirits in the Museum of the College of Surgeons, named "Testudo picta." The shell is pale brown; each of the costal shields has two concentric very narrow rings near the margin, and an irregular ring in the centre, the continuity of which is often more or less interrupted. The vertebral plates have a similar double ring, but both the marginal and central ones are more irregular and interrupted. The upper surfaces of the marginal plates are each marked with a single submarginal ring and a larger central spot. The sternal shields are brown-dotted, with a brown band near the margin of each.

b. Sternum divided by a central axis suture, attached to the thorax by a ligamentous suture, covered by the end of the pectoral and abdominal shields; vertebral plates 12; axillary and inguinal plates very small.

Emys d. a, b, Gray, Cat. Tort. B.M. 13.

Pyxidemys (clausa), Fitz. Syst. Rept. 29.

Terrapene, Kinosternon and Sternotherus, sp., Bell.

M. Daudin divides the Tortues à boîtes (T. clausa) thus:—

* With both ends movable. 1. T. Retzii. 2. T. tricarinata. 3. T. Pennsylvanica.—** With the hinder end only movable. 4. T. odorata. 5. T. submigra. 6. T. virgulata. 7. T. clausa. 8. T. brevicauda.

Cuvier, Rép. Anim. ii. 11 (1817), ed. 2. ii. 12, adopts Daudin's divisions.

Merrem gives to the Tortues à boîtes the generic name of Terrapene (p. 27, &c.).

Mr. Bell, Zool. Journ. ii. 302, 486 (1826), in his paper on the Box Tortoises, forms a subfamily of Emysidae for them under the name of Sternotherina, and refers to it the following genera:—

2. S. Leucianus (14), which is the same as K. nigricans.

3. S. odoratus. 4. S. Boiei = Kinosternon Pennsylvanicum; the
same as Kinosternon, as regarded by Daudin.  III. TERRAPENAE, Merrem. 1. T. Europaeus, 2. T. Caroliniana. 3. T. maculata (pp. 309, 486); both mere varieties of T. Caroliniana. To these, at p. 484 of the same volume, is added as a new species: 5. T. bicolor (t. 16), said to come from North America, but it proves to be the same as Kinosternon Luteovitae of the former paper.

† Legs with large scales in front; toes narrowly webbed, shielded above.

10. CISTUDO.

Head moderate, covered with a thin, hard, continuous skin; forehead flat. Eyes lateral. Legs covered with large angular shields, those on the inner side broadest. Toes short, very narrowly webbed to the claws. Tail short. Shell ovate, convex, solid. Sternum broad, rounded before and behind, completely closing the cavity of the thorax, affixed to it by a ligamentous symphysis, and divided by a cross suture between the pectoral and abdominal plates; the front lobe very large, almost entirely free from the symphysis; sternal shields 12;inguinal and axillary plates none; marginal plates 25 or 27; nuchal plate small.

North America.

CATALOGUE OF SHIELD REPTILES.

**Claws 5–3. Vertebral plates 6. Oonychotria.**

Shell oblong, dark brown, pale spotted and rayed, spots and rays sometimes confused; vertebral plates with a nearly continuous keel, and with a small intermediate one between the usual fourth and fifth plate; hinder margin acute, revolute. Head pale brown; forelegs yellow or orange spotted, hinder uniform brown; sternum flat, gular plate wider in front and gradually narrowed behind.

Hub. Mexico; New Orleans.

1. **Lutremys.**

Head ovate; forehead rather convex; cheeks sloping. Eyes subsuperior. Legs covered with large thick scales in front; those of the outer side oval, keeled; of the inner broad, band-like. Toes short, thick, covered with band-like shields above, well webbed to the ends; claws 5–4, short, curved. Tail conical. Shell depressed, rounded. Sternum broad, rounded before, rather truncated behind, entirely enclosing the limbs when they are contracted. The cross suture between the anterior and the posterior lobe in the middle of the short sterno-costal suture. Axillary and inguinal plates very rudimentary.

Lutremys (part.), Gray, Cat. Rept. B.M.

Fleming, Phil. Zool. ii. 270.

Emys a, Wiegler, Syst. 138 (1830).

Shell depressed, ovate, brown, with radiating lines of yellow dots; sternum slightly nicked behind. Head and body black, yellow-dotted; tail elongate.

g. Adult (stuffed). Europe. From the Haslar Hospital Museum.

i. Adult (in spirits). Europe. From the Zoological Society.

OSTEOLOGY.

a. Adult (shell only). Black, yellow radiately dotted. South Europe.

h. Skeleton. Europe.

The areola of the young specimen is marked with dark-edged sinuous lines on the discal shields, and a subcentral ring on the marginal ones; these marks are sometimes to be seen on the areola of the plates of the adult. The other parts of the shields are destitute of any rings, and generally radiately spotted and streaked.

++ Legs with thin band-like shields in front. Toes broadly webbed, with small scales above.

12. CUORA.

Head covered with a thin skin, rhombic; forehead flat; cheeks flat. Eyes lateral. Legs strong, covered with broad, band-like, transverse shields. Toes strong, covered with distinct band-like shields above, widely webbed to the toes. Claws 5-1, strong, curved, acute. Tail moderate. Shell convex, very solid, three-keeled, at least when young. Sternum broad, rounded behind and before, completely closing the cavity of the thorax; the front lobe large, affixed behind, with the cross suture nearly in the middle of the bony sternum-costal symphysis; anterior lobe large, with the hinder part enclosed in the symphysis; sternal shields 12; axillary and inguinal shields small, distinct; marginal plates 25; nuchal plate small. Asia.

Shell convex, like Cistudo. The legs and feet are those of an Asiatic Emys.

Shell hemispherical, slightly three-keeled, blackish; margin broad, expanded; nuchal shield linear, sternum black and yellow variegated. Animal blackish, yellow-variegated; head dark, with two broad yellow streaks on the side from the nose.

Hab. China.

Osteology:

d. Upper shell only. Like a. China.

OE

13. CYCLEMYs.

Head ovate, covered, with a thin skin; forehead rather convex. Eyes subterminal. Legs strong, covered in front with thin, broad, band-like, transverse shields. Toes strong, covered with small scales above, webbed to the claws; claws 5-4, short, curved, acute. Tail moderate. Shell convex, solid, edge-toothed behind. Sternum rounded in front, truncated behind, narrower than the cavity, not covering the legs when contracted, with a distinct process on each side to form the symphysis. The cross suture between the anterior and posterior lobes in the middle of the long sternocostal suture, so that both lobes are equally attached to the thorax. Asiatic.

This genus has the same shield-like and well-webbed toes as Emys and Cuora, but differs from the latter in the sternal lobes being narrower than the opening of the thorax, so that, as in Emys, it does not cover the legs when they are contracted. This similarity has induced naturalists to place the species in the genus Emys, overlooking the fact of the lobes being mobile.

Fitz. Syst. Rept. 29 (1843).

1. CYCLEMYS dentata. The Dhor. Tab. XIX.

Shell subobviou; back flattened, keeled, hinder edge toothed; sternal shields yellow, brown-rayed.

Tetramys affinis, Cantor, Cat. Rept. Malac. 67.

Hab. Java; Batavia; Borneo; Pinang (Cantor).

Var. 1. Sternum raised on the sides.

Bell, Testudinidae, vii. t. 3, lower figure.
a. Young (in spirits). Suborbicular, depressed, brown, black-dotted, blantly keeled, edge acutely toothed; vertebral plates square, as broad as long; sides of neck and throat yellow-lined; feet yellow-spotted. Java.

**Var. 2. Sternum nearly flat, the lobes rather broad, somewhat like a Cooraa.**

Bell, *Testudinidae,* viii. t. 3, upper figure.

**Osteology:**

c. Adult (skeleton). First dorsal narrow, arculate; plates worn. Java. From the Leyden Collection.

Dr. Cantor describes three very young specimens of a Tortoise (the largest being only 2½ inches long), which were taken on the sea-shore of Pinang, under the name of *Tetramor?s affinis.* The Malays assert that this Tortoise also inhabits estuaries and rivers in the Peninsula, and that it grows to a considerable size. The outline of the shell and its composing shields strikingly resemble the young of *Cyclemys orbicularis,* Bell—*Cat. Rept. Penins. 6.*

There can be little doubt that the above were the young of this species, which often has only 4 claws on the feet.

Shell ovate, convex, yellow-dotted, with the centre of the back quite flat, as if truncated; shields striated; areola of dorsal shield central, of costal superior; vertebral shields broader than long, 6-sided, 5th keeled; the front and hinder margin strongly toothed. Sternum flat, truncated before and slightly nicked behind. Tail moderate, tapering.

E. Recessi, adult?; *Dum. Cat. Mèth. B. 15?*

**Hab.** Sumatra (Müller); Pinang (Cantor, *Cat. 3*); Cochinchina (Duver). a. Adult (stuffed). Sumatra?

b, e, d. Adult, and half-grown (stuffed). Head yellow, varied with a broad yellow streak on each side of the nape; throat yellow-streaked. Singapore. Mr. Wallace’s Collection.

c. Young. Shell only, with the ribs about half closed; vertebral plate with two costal plates, with one raised black spot on the middle of the hinder edge of the nucelus. Singapore. Mr. Wallace’s Collection.

e. Young. Shell only, with the ribs about half closed; vertebral plate with two costal plates, with one raised black spot on the middle of the hinder edge of the nucelus. Singapore. Mr. Wallace’s Collection.

f. Very young. Shell very thin, with the black spot only very indistinctly marked.

They are called “Katong” by the Malays in the Peninsula. The head and neck, shell, tail and feet of the adult living animal are dirty yellowish or greenish brown, which becomes paler on the sternum. The nuclei of the vertebral shields are slightly raised; the costal shields are depressed, their sides sloping towards the nuclei, thus forming as it were a very shallow hexagonal basis. The front and hind margins are broadly revolute, their toothed appearance worn off. The sternum is slightly concave in the centre. They inhabit the valleys of Pinang, and in confinement they refused to eat, and were never observed to enter a tank.—Cantor.

c. Sternum divided by two cross sutures; central lobe attached to the thorax by a bony symphysis, covered by the end of the abdominal shields only; vertebral plates 11 or 8; the axillary and inguinal plates large.

Var. 1. Hinder part of sternum entire.

b. Stuffed (not in good state; wants dorsal plates; no appearance of keels). Central America.

c. Animal dry (shell wants dorsal plates; no appearance of keels). Central America.

Kinosternon scorpioideum, var. acuta, Gray, Syn. 14. t. 7. f. 1.
d. Adult (animal and shell, in spirits). Back very convex, rounded, distinctly three-keeled; sternum rather convex; tail very short; spine very small. Female? Tropical America. Presented by Thomas Bell, Esq.
e. Adult (animal and shell, in spirits). Back convex, rounded, distinctly three-keeled; sternum flat; tail elongate; claws very strong. Male? Tropical America.
y. Adult (stuffed). Dorsal keels very distinct, vertebral plates small; tail elongate. Mexico.

Var. 2. Hinder part of sternum notched. Males.

l. Adult (animal, dry). Dorsal keels regular, distinct.

Hab. Bolivía; Santa Cruz de la Sierra (D’Orbigny).

Var. 3. Back depressed.

Hab. North America (Duméril).

Osteology:

Kinosternon scorpioideum, Wagler, Syst. Amph. t. 5. f. 31-43.

a. Shell only, swollen and convex, wanting some plates. Dorsal keels only marked by very obscure lines. Central America. Presented by Dr. J. E. Gray.

b. Adult. Back rounded; dorsal keel only marked by a very slight line.

Var. 2. Hinder part of sternum notched. Males.

1. Adult (animal, dry). Dorsal keels regular, distinct.

Hab. Bolivía; Santa Cruz de la Sierra (D’Orbigny).

Var. 3. Back depressed.

Hab. North America (Duméril).

Carapace swollen, oval, suddenly inclined behind, three-keeled, red-brown; sternum not nicked behind, yellow-brown. Head yellowish-green, darker above; head, neck and limbs with small blood-red lines.

Kinosternon cruentatum, Daud. & Bib. MSS.
Hab. North America (Duméril).

Sternum oblong, anterior and posterior lobes broad, rounded, entire; the gular shield broad, short; the pectoral and femoral shields triangular, almost reduced to a point at the inner margins. Head brown, pale marbled; temple with three streaks of small white spots from the hinder edge of the orbits; chin white-streaked and dotted; throat with three distant, very white streaks.

Shell of young dark brown, with a small dark spot on the centre of each dorsal and marginal shield, and with a moderate round white spot on the under side of each marginal plate, edging the plate, a large spot on the middle of each axillary and inguinal plate, and a larger more irregular-shaped one on each sternal plate.

Shell of adult oblong, convex, not keeled, dark brown, often eroded, yellow-brown beneath.

Shell of males oblong, rather narrow; sternum flat or slightly concave; head large; tail elongate, thick, conical, with a large terminal claw;—of females oblong, rounded, broad; sternum flat or rather convex; head moderate; tail short, conical, with a small terminal spine.

Kinosternon oblongum, Gray, Cat. Tort. B.M. 33.
Hab. North America; New York to New Orleans.

i. Just hatched (stuffed). North America.

j, k, l, m, n, o. Adult (stuffed). Males and females. North America; Louisiana. Mr. Smith's Collection.

In the adult specimens from New Orleans in spirits the head is dark brown, with irregular white spots on the occiput; all of them have two broad dark-edged streaks from the back of the orbit, the upper extended along the side of the neck, the lower to the hinder end of the back, and an intermediate small pale spot on the tympanum; these marks all become more obscure on the older specimens.

The young specimens, with the same description of colouring and from the same locality, vary a little in the comparative width and form of the lobes of the sternum, even when they have the same form of tail, which is supposed to mark the sexes.

Tab. XX.

Shell narrow, oblong, smooth, sides convex, back flattened; sternum high on the sides, lobes much narrower than the cavity, rounded in front, bifid behind, the symphysis very short.

Kinosternon Doubledayii, Gray, Cat. Tort. B.M. 33.
Hab. California.
a. Shell only (much worn). California.

Very like the preceding (K. Pennsylvanicum), but the sternum is much more raised on the sides.

Sternum rather lozenge-shaped; anterior and posterior lobes rather tapering, with nearly straight edges, the hinder
truncated behind; the pectoral, and especially the femoral plates, subtrigonal, moderately broad at the inner margin. Head brown, minute and closely pale dotted, with a short oblique dark-edged streak on the hinder margin of the upper beak; throat pale dotted; thorax brown, with a few brown dots and a small dark spot at the apex of each dorsal and marginal shield; under side and hinder edge of marginal shields pale brown varied and lined; sternum pale, slightly dotted and marbled with blackish brown.

_Hab._ North America.

a. In spirits (young). Female. Shell oblong, broad, tail small; conical. Shield granular, rounded, entire. Head brown, minutely darker dotted; temples with three streaks of small white spots from the hinder edge of the orbit; chin white streaked and dotted; throat with three distant very narrow white streaks.

_North America, East Florida_ (E. Doubleday).

Sternum oblong, anterior lobe broad, rounded, posterior lobe broad, rather truncated behind; gular plates very narrow; pectoral and femoral plates triangular, narrow, reduced nearly to a point on the inner margin. Head brown, minutely dotted, with a broad pale streak from the nostril over the eyes to the side of the occiput; temple with a second similar streak from the lower part of the hinder edge of the orbit; throat brown. Shell of young brown, with a few brown dots and a small dark spot at the apex of each dorsal and marginal shield, and a small pale spot on the edge of each marginal shield. Sternum pale brown, shield darker edged; of adult uniform olive-brown, with black edges to the shields; beneath yellowish brown, darker varied.

_Hab._ North America; New Orleans (M. Sallé).

c. Half-grown (stuffed). The broad yellow band marking the upper part of the nose and crown is distinct, but the streaks on the temple are not to be observed in its present state. The dorsal and marginal shields are uniform brown, with a narrow margin, especially on the hinder edge. The pectoral and abdominal plates are united together in this specimen, so that the front lobe of the sternum must have been perfectly immovable.

_North America._

Carapace ovate, smooth, rather convex, reddish-brown, hinder part slightly, back very slightly keeled; sternum not notched in front, yellow-brown. Head moderately large, depressed; jaws white; head and neck with some reddish-yellow spots.

_Cinosternon leucostomum, Dum. & Bib. Erp. Gén. ii. 570; Cat. Rept. Mus. H. Nat. 17._

OSTROLOGY. Tan. XXXVIII. fig. 1, Tan. XL. fig. 2, skull (half-grown).
Tortoise serpentina, Curr. Obs. Foss. v. 185, skull.

"This species is very voracious in its habits, and destroys great quantities of fish; it is also more ferocious than any other, and will seize with violence at anything presented to it, and not let go its hold even when the head is separated from the body. The wound inflicted by its bite is very severe. It is much sought after as an article of food; when old the flesh is mushy."—Leconte.

18. MACROCLEMYS.

Head very large, covered with numerous symmetrical, smooth, horny plates; chin two-bearded. Neck thick, with large beards, horny at the tip. Tail conical, with a central series of compressed tubercles. Claws 5-4, strong. Back convex, three-keeled, toothed behind. Marginal plates 31, produced, subtubercular, those on the centre of each side in a double series. Skull: nose produced in front; palate deeply concave. Sternum slender, cross-like, acute at each
end; sternal plates six pair, thin; the narrow lateral prolongations of the sternum covered with a peculiar plate, and often having some additional ones between it and the sternal plates on the inner and marginal plates on the outer side; gular and anal plates small, generally united, triangular.

Carapace strongly three-keeled, rounded, deeply serrated behind.

20. DERMATEMYS.

Head —-? Toes ——? Claws ——? Shell oblong, convex, not keeled, sides rounded; hinder edge expanded, slightly reflexed, covered with very thin membranaceous shields; hinder marginal shield broad. Sternum flat, rounded in front, notched behind; the gular plates small, triangular, united to the upper shell by a bony symphysis, covered with the end of the pectoral and abdominal plates; the sterno-costal sutures covered with four moderate-sized, distinctly defined plates; the anterior small, and two hinder largest. The axillary and inguinal plates none. The cavity of the shell is scarcely contracted at the opening. South America.

_Wiegmu. Arch. 1848, 197.*

1. Dermatemys Mawii. Mawes' Dermatemys.

_Tab._ XXI.

First vertebral plate seven-sided; second, third and fourth longer than broad. Shell pale brown, upper surface covered with small close irregular depressions of a darker brown colour; shields pale, nearly transparent, very brittle.
CATALOGUE OF SHIELD REPTILES.

When dry; under surface uniform pale yellowish-white, with slightly sunken grooves.

Wiegmann. Arch. 1848, 167.

Emys Berardi, Dum. & Bib. MSS.

Hab. South America (Lieut. Mawe).

The species, which is not quite full-grown, has much the external appearance of Phrynops Geoffroyi; and the general thinness of the scales of the Chelydidae; but there is no appearance of any scar on the inner surface of the sternum for the attachment of the pelvis, and though the gular scale is worn and nearly obliterated, yet it is sufficiently distinct to show that it has no intergular plate.

Emys Berardi of Duméril’s Catalogue of the Paris Museum is perhaps intended for this species. It is thus described:

"Shell yellow-brown, irregular, rugose, with a multitude of small verruculations; elongate, subovol, narrowed above the fore legs, rather sinuous behind; hinder part of back slightly keeled; malleal small, short; first vertebral produced in front. Chest yellow, entire in front, notched behind. Head uniform brown, flat, broad, rather large; jaws toothed. Toes broad-webbed. Tail strong, rather long.

"Hab. South America (Mawe); Verre Cruz (Berard)."

This is more likely to be the case, as Mr. Fraser’s note, in the Catalogue of the Museum of the Zoological Society, shows that M. Bibron must have examined it, and these authors give the habitat as "South America (Mawe)," in their account of the species. If this be the case, M. Bibron must have changed the name after his return to Paris.

Fam. III. CHELYDIDÆ (CHELIDES).

Head much depressed, broad, covered with a soft skin or hard shields; nostrils elongate, tubular; eyes superior; jaws horny. Neck long, broad, contractile, heat under the side of the shell in repose. Feet webbed. Toes 5·5, deeply webbed, with a lobe between each claw. Claws 5·5, 5·4, or 4·4, elongate, acute. Shell depressed, covered with horny shields; caudal pair always separate. Sternum attached to the thorax by a short bony suture, covered with the outer ends of the pectoral and abdominal plates, and with an additional intergular plate in front. The axillary and inguinal plates very small or none. Pelvis large, united to the vertebra and the hinder lobe of the sternum, leaving a scar. Living in ponds and rivers, in warm climates. Eating flesh; feeding only in the water: swimming with their whole shell under water.

Emys, sp., Brousson. (1803).

Oppel, Rept. (1811).

Merrem, Test. 23.

Testudinidae, Wiegler, Syst. 133.

In the Annals of Philosophy for 1825, I formed a section of Emys *** for Emys loculicollis — "Toes 4·4; sternum thirteen-sealed," — and remarked: "The phalang of the last subgenus is covered with thirteen scales, that is, six pair marginal, and an unequal-sided hexagonal one in the middle of the anterior lobe." I have only observed an approximating distribution of the plates in a species of Sternotherus; all the other Emys that I have seen have had only the six pair of marginal plates, the first pair sometimes soldered so as to form only eleven plates.

Mr. Bell, after stating that the same number of sternal plates exists in Sternotherus Leuckiinus and the two species of Chelys (see Zool. Journ. iii. 512, 1838), overlooked the other anatomical characters which unite these genera, and made no proposal to unite them into a natural group.

Duméril and Bibron in their large work merely change the name of the family as given in my Synopsis.
1. **Sternothérus**. Shell roundish, rather convex, side plates narrow, front one very short and square. Nuchal plate none. Sternum broad, front lobe rounded before, moveable, and furnished on each side of its hinder edge with an internal bone process, covered by the gular, humeral and pectoral plates; central lobe only covered by the abdominal plates; hinder lobe bifid, with an internal scar. Intergular plate marginal, between the gular. Beaks naked. Toes short, strong, shielded above, strongly webbed. Claws 5, strong, sharp.

Pelusios, Wygler, Syst. 137 (1830).

Fitz. Syst. Rept. 29.

The genus Sternothérus of Mr. Bell (Zool. Journ. ii. 305) is exactly synonymous with one of Daudin’s sections of the *Tortues à boîtes*, and contains species of the genera *Cistudo*, *Kinosternon*, and the present genus, *Sternothérus*.

Mr. Bell, in his second paper (Zool. Journ. iii. 515), gives as the type *S. Leachianus*, which is the same as *Terrapene nigricans* of his former paper (Zool. Journ. ii. 305)—placing the genus with the other box tortoises in *Euglydidae*, between *Terrapene* (class) and *Kinosternon*. In my Synopsis of Reptiles I defined the genus so as to confine it to the species similar to that type; and Duméril and Bibron, in their work, adopted my views. Wagler uses *Pelusios* for the same group.

Wagler (Syst. Rept.) quotes Mr. Bell’s first species, *S. trifasciatus*, as the type of his genus.

* “Muzzle elongated, conical; upper jaw hooked.”—Duméril.*

1. **Sternothérus niger.** The Black **Sternothérus**.

Shell oval, short, swollen, narrower in front, deep black; muzzle elongate; upper jaw hooked; covering the lower. Head elongate, with two large parietal, a long fronto-nasal, and a moderate frontal shield; upper jaws hooked.

In the text, MM. Duméril and Bibron refer their figure t. 20, f. I, to this species; but on the plates and in the explanation of the plates they name it *S. castaneus*, and it agrees with the latter in having a short head.

** Muzzle short, rounded.

2. **Sternothérus subniger.** The Blackish **Sternothérus**.

Vertebral plates square, as long as broad, the fourth...
broader than long; two anterior marginal plates narrower than the first vertebral; sides of the hinder lobes of the sternum contracted in front; muzzle rounded. Jaws pale yellowish.

Sternotherus subniger, Grey, Syn. 38; Cat. Tort. B.M. 37.
La Tortue noireâtre, Lacép. Q. O. i. 175. t. 13.

Pelusios subniger, Wagler, Syst. 137.
_Fitz. Syst._ Rept. 29.
Emys subniger, Schweig. Prod. i. 315, 438.
_Hab._ Africa; Madagascar.

_a._ Adult animal (dry); shell worn. Africa.

_b._ Adult (stuffed); shields slightly grooved. From the Paris Museum.

_c._ Half-grown (in spirits); lost its dorsal shields; shell short, rounded and convex.

3. _Sternotherus castaneus._ The Natal _Sternotherus._

Vertebral plates broad, nearly square, nearly as long as broad, the fourth six-sided, longer than broad. Jaws pale yellow. Sides of the hinder lobes of the sternum straight.

Sternotherus castaneus, Gray, Syn. Rept. 38; _Cat. Tort._ B.M. 37.
_Dum. & Bib. Exp. Gén._ ii. 401. t. 20. f. 1; _Cat. Méth._ R. 19.
Emys castanea, Schweig. Prod. 324. no. 38.
E. Conro, var., Schiegel, Fann. Japon. 64.
Testudo subnigra, _Daud. Rept._ ii. 198.
Sternotherus Leachianus, Bell, Zool. Journ. ii. t. 14 (young?).
Pelusios castaneus, Wagler, Syst. 137.
_Hab._ South Africa; Madagascar (Quoy).

_a._ Adult (stuffed). Two anterior marginal plates narrower than the first vertebral. Sternum of (a) flat, of (b) concave. Port Natal. From Dr. Krauss’s Collection.

Osteology:—

_c._ Adult shell. Vertebral plate bluntly keeled; two anterior marginal plates nearly as broad as the first vertebral. Sierra Leone.

The figure above cited of _Sternotherus sinuatus_ of Dr. A. Smith is very like specimen “a,” but the first vertebral plate is broader and not so long.

4. _Sternotherus Derbianus._ Lord Derby’s _Sternotherus._ Tab. XXII.

Shell oblong, convex, round; vertebral shields narrow, six-sided, much longer than broad, the last subtriangular.

Head broad, the parietal and crown plates united into one; muzzle bluntly rounded; the sternum broad, with the hinder portion scarcely contracted in front, the front much rounded; the central gular plate broad ovate, angular behind; two anterior marginal shields as wide as the front vertebral. Jaws dark-lined.

_Hab._ West Africa.

_a._ Adult (stuffed). Vertebral plates elongate, very narrow, half as long again as broad. West Africa; Gambia. Presented by the Earl of Derby.

Osteology:—

_b._ Adult shell. Vertebral plates square, rather longer than broad. West Africa; Sierra Leone.

This species is separated from _S. castaneus_ and _S. subniger_ by the shape of the vertebral plates, which in these species are broad, six-sided; in the _S. castaneus_ they are nearly as broad as long, and in the _S. subniger_ the third and fourth are broader than long, and the fourth is ovate and swollen behind. Perhaps they may all prove only to be varieties of the same species, or dependent on age.

5. _Sternotherus Adansonii._ Adanson’s _Sternotherus._

Shell oval, fulvous, brown-spotted, back strongly keeled; front vertebral plates much longer than broad. Sternum mobile in front, yellow, more or less varied with reddish-brown. Head flat, broad; tail short.

Emys Adansonii, Schweig. Prod. 308. 27.
_Hab._ South Africa; Madagascar (Quoy).

Emys Adansonii, Schweig. Prod. 308. 27.
_Hab._ Cape de Verde; White Nile. _Mus._ Paris.

2. _Pelomedusa._

Head much depressed, shielded with two narrow frontals, separated by a groove, a large vertebral shield, and a large cheek-shield on each side. Chins two-bearded. Beaks exposed. Neck broad. Legs with strong hand-like shields in front, quite retractile. Tors short, strong, shielded above, webbed to the tips, with a large rounded lobe

Pelomedusa, Wagler, Syst. 136 (1830).
Gray, Cat. Tort. B.M. 38.
Fitz. Syst. Rept. 29.
Pentonyx, Rüppell, M.S.S. Mus. Frank. (1831). 

* Pectoral shields small, short, triangular; humeral large; occipit with small shields. Pentonyx.

Olives; shields radiately and concentrically grooved; beneath pale yellowish-white, very slightly keeled; pectoral shields triangular, not reaching to the central line.

Pelomedusa Gehafiae, Gray, Cat. Tort. B.M. 38.
Pentonyx Gehafiae, Rüppell, Mus. Frank. (1831). 

Hab. Abyssinia.

a. Adult (stuffed). Abyssinia. From Dr. Rüppell's Collection.
b. Young. Abyssinia. Dr. Rüppell's Collection.

** Pectoral and humeral shields equal, oblong, four-sided, trapezoidal; occipit largely shielded. Pelomedusa.

Shell brown, olive, ovoide oblong; first vertebral plate short, very broad in front.

Pelomedusa subrufa, Gray, Cat. Tort. B.M. 38.
Testudo subrufa (La Roussetière), Lapey. Q. O. i. 173. t. 12; Essey, Méth. t. 6. f. 3. 
Testudo subrufa, Latr. Rept. i. 120. 

* Pectoral shields small, short, triangular; humeral large; occipit with small shields. Pentonyx.

Testa oblonga, in medio coarctata, minime carinata, scutis distinctis olivaceo-brunneis flavo-maculatis tribus lineis castaneis circumdata.

Hab. New York (!).

b. Claws 5-4. Head covered with a thin skin, entire, or divided into small flexible shields.

Chelydidae A. 6, Gray, Cat. Tort. B.M. 36.

3. PLATENYS.

Head moderate, flat, covered with a continuous thin skin. Temple with small scales. Beaks naked, weak. Chin two-
CATALOGUE OF SHIELD REPTILES.

Bearded. Neck warty on the sides. Hind legs with a series of three or four large compressed scales, forming a large compressed lobe on the outer edge. Legs with large hexagonal scales in front. Toes strong, with a few broad shields above, webbed. Claws 5-4, acute. Shell oblong, depressed, flattened above, lateral margin revolute. Nuchal plate distinct; anterior vertebral plates broad, large. Sternum solid, not mobile, rounded in front, deeply notched behind. Tropical America.

Platemys, Wagler, Syst. 135 (1835).

Gray, Cat. Tort. B.M. 41.

1. Platemys planiceps. The Doubly-keeled Platemys.

Shell quadrangular, fulvous, marked on each side of the disk with a large black spot; back with two rounded keels, separated by a broad groove; costal plates not arched; sternum black, yellow-edged; margin yellow, with triangular brown spots. Head covered with a thin single plate; crown yellow.

? E. Schöpfelii, Wiegmann.

Hub. Brazil; Cayenne; Surinam.

a. Adult (in spirits); lost part of the shields. Guiana.
b. Adult (in spirits); lost many of the shields. British Guiana. Mr. Schomburgh's Collection.
c. Adult (stuffed). Rio Negro; Brazil. Mr. Bates's Collection.

Osteology:—
Platemys canaliculata, Wagler, Syst. t. 4. f. 4-26.

M. Schlegel regards Emys nasuta, E. Geoffroyana, Schweig., E. atlae, E. depressa, E. canaliculata, E. rhyphes, E. eiridia, Spix, E. Maximilliana, E. radiolata, Mikau, E. depressa, Nenwied, and E. pachyura, Boie, as all synonyms of this species! Other naturalists regard them as belonging to more than one genus.

4. HYDRASPIS.

Head moderate, flattened, covered with a thin skin, divided into numerous subsymmetrical plates. Backs naked, slender, weak. Chin two-bearded. Hind legs with a compressed scaly tubercle on the outer side, above the foot. Toes webbed. Claws 5-4, acute. Shell oblong, depressed, back flattish, lateral margin revolute. Nuchal plate distinct, anterior vertebral plate larger than the other, often very broad. Sternum solid, not mobile; lobes broad, the front one rounded. Tropical America.

Fitz. Syst. Rept. 29.
Chelodina, sp., Fitzinger.
Phrynops, Gray, Cat. Tort. B.M. 41.
Wagler, Syst. 133 (1830).
Fitz. Syst. Rept. 29.

† Neck warty above. Lower part of the front of the hind legs with a compressed wart formed of two large compressed scales, with a group of five or six unequal scales on the lower side beneath them. The first vertebral plate wider than the others.

Shell oval oblong, convex, middle of the back flattened, with a narrow central groove; costal plates arched; sternum black. Head with numerous small plates; chin two-bearded; neck with conical acute spines; the two outer toes of the fore-feet small, with short rudimentary claws; the lower part of the outer side of the front edge of the hind legs with a compressed tubercle, formed of two compressed scales.

Hydraspis Spihii, Gray, Cat. Tort. B.M. 38.

Emys depressa, Spix, Bros. t. 3. f. 2 (not Newied).
Rhincnys nasuta, var., Wagler, Syst. 134.
Hub. Brazil.

++ Neck nearly smooth. Lower part of hind legs rounded in front, and covered with five or six rather larger convex scales, the last keeled. First vertebral plate almost as wide as the others. Rhinemys.

Rhinemys, part., Wagler.

Duméril and Bibron separate the species belonging to this section thus, showing the very slight characters which divide them:—

1. Back keeled the whole length.
   * Sternum reddish. 6. H. rufipes.
   ** Sternum brown, ends yellow. 4. H. nasuta.

II. Back interruptedly keeled.
   ** Sternum not spotted. 14. H. Geoffroyana.

III. Back keeled on the last three plates. 3. H. gibba.

IV. Back not keeled.
   * Discal shields concentrically and radiately striated. 9. H. radiola.
   ** Discal shields longitudinally striated; sternum black, yellow-edged. 11. H. Gaudichaudii.
   *** Discal shields smooth.
   † Sternum yellow; thorax brown, uniform. 5. H. Wagleri.
   ‡ Sternum yellow; thorax brown, black-rayed. 8. H. depressa.
   +++ Sternum brown, yellow-edged. 7. H. Millusii.

* Animal one-coloured.

Tab. XXIII.

Shell oblong, depressed, middle of the back flat, margin very broad in front, narrow and bent up on the sides, broader and arched over the hind legs; first vertebral shield large, as wide as long; third and fourth narrow, longer than broad; fourth and fifth with an acute keel on the hinder edge. Sternum rather broad. Head very large; crown and temple covered with small shields; ears prominent; neck smooth; lower part of the outer edge of the hind leg with four larger scales, the last compressed, largest.

Hab. Brazil; Pará.

a. Adult (stuffed). First vertebral plate nearly square, two last vertebral plates keeled. Brazil; Pará. Mr. Bates's Collection.

Osteology:—

This species is very like H. gibba, but the back is more depressed, the margin much wider; the head nearly double the size, compared with the size of the body; the scales on the margin of the hind legs larger and more equal-sized, and the scales of the head small, more numerous and more equal in size. See Proc. Zool. Soc. 1853.

Shell black, ovoid, middle of the back convex; discal plates slightly striated, the last three vertebral plates tubercularly keeled behind; costal flat; sternum brown, varied with yellow on the edge. Head moderate, covered with many small symmetrical plates. The crown with five elongated shields, two in front and two behind, and one central; the two front shields produced in front nearly to the back edges of the orbits.

Hydraspis gibba, Gray, Cat. Tort. B.M. 40.

Enyś gibba, Schweig. Prod. 299. no. 7.

Rhinemys gibba, Wagler, Syst. 135.

Platemys gibba, Dum. & Bib. Erp. Gén. ii. 416. t. 20. f. 2; Cat. Mèth. R. 20.

Hydraspis cayennensis β, Gray, Syn. 42.

Hab. South America.

a. Adult (stuffed). The lower part of the outer edge of the hind-legs with three or four rather larger scales, the last much larger and keeled; caudal plates higher than long. "Madagascar?" From M. Parzudaki's Collection.

Shell roundish oblong, much depressed, keeled, waved, fulvous, hinder edge yellow; sternum brown, sides and ends yellow. Head depressed; crown separated from the forehead by a straight line, with five nearly equal-sized shields, two in front and behind, and one in the centre between them.

Hydraspis nasuta, Gray, Cat. Tort. B.M. 40.

Enyś nasuta, Schweig. Prod. 298. no. 4.

Enyś platycelphala, var., Schlegel, Fann. Japon. 46.

Rhinemys nasuta, Wagler, Syst. 134.

? a. Young (in spirits). Lower part of outer side of hinder legs with four or five convex scales. Tropical America.

The Museum specimen is very like what may be the young of H. gibba, but the head shields are different.

Shell oval, much elongated, narrowed at each end, keel-less, rounded in front and truncated behind, reddish-brown; shields smooth; the first vertebral protuberant, three-sided; sternum yellow. Head flat, smooth; temple with small scales.

Hydraspis Wagleri, Gray, Cat. Tort. B.M. 40.

Shell brown, oval, truncated in front, angular behind; back keeled; sternum narrower behind. Neck and members reddish, with an oblong red spot above the ear; head smooth, with one large frontal, three elongate occipital, and many small scales on the temples.

Emys rufipes, Spix, Brus. 7. t. 6. f. 1, 2.
Hydraspis rufipes, Gray, Syst. 41.
Emys platycephala, var., Schlegel, Fauna Japon. 46.
Rhinemys rufipes, Wagler, Syst. 134. t. 3. f. 43, 44, 45.
Fitz. Syst. Rept. 29.
Phrynops rufipes, Gray, Cat. Tort. B.M. 41.

In Spix’s figure of this species the superciliary plates are united to the frontal. It is very like our specimen of H. nasuta.

Shell oval, narrow and rounded in front, obtusely angular behind, keel-less, black-brown; shields smooth. Sternum brown, yellowish washed on the edge and middle line; abdominal plates large; head broad, thick, smooth; temple with small scales.

Emys stenops, Spix, Brus. 12. t. 9. f. 3, 4 (very young?).
Emys platycephala, var., Schlegel, Fauna Japon. 47.
Rhinemys nasuta, jun., Wagler, Syst. 134.

The figure of Emys stenops represents the crown and temples covered with small shields.

The last three species may be only varieties or different-aged specimens of H. nasuta.

** Animal and shell banded or spotted.

Shell oval-oblong, rounded at each end, not keeled, olive-brown, black-rayed, hinder margin yellow; blackish-grey, side of the head with three black rays; throat whitish, black-spotted. Sternum narrower behind than in front. Head covered with very small shields diverging from a small central vertical shield. Neck granular. The inner sides of the front of the hind legs with three or four convex slightly keeled scales, outer side with six small keeled shields.

Hydraspis depressa, Gray, Syst. 41; Cat. Tort. B.M. 39.

Rhinemys depressa, Wagler, Syst. 134.

Hab. South America; Brazil?

a. Young, in spirits. Sternum with many small spots.
South America. Presented by Dr. Edward Rüppell.
b. Half-grown, in spirits. Sternum with fewer large spots.
South America; British Guiana. Presented by Chevalier Schomburk.

Shell oval-oblong, narrowed and rounded in front, rather obtusely angular behind, keel-less, brown, varied with reddish; shields concentrically and radiately striated. Sternum broad before and behind. Head covered with numerous scales; neck tubercular.

Hydraspis radiolata, Gray, Syst. Rept. 44; Cat. Tort. B.M. 39.
Emys radiolata, Mikan, Delect. t.
Novemied, Beitr. Bras. i. 39; Abbild. t.
Rhinemys radiolata, Wagler, Syst. 165.
Emys platycephala, var., Schlegel, Fauna Japon. 47.

Allied to H. depressa, but the sternum is represented as broader behind.

*** Species requiring further examination.

Shell (young) very depressed, very obscurely keeled, brown; middle of the hinder edge of vertebral shield
rather elevated, margin very much expanded, deeply serrated behind; beneath, yellow brown-rayed and varied. Sternum narrow, rather broader in front, attenuated and deeply acutely lobed behind. Head brown, moderate, with two subtrigonal hard occipital shields, and small shields on the temples; chin two-bearded; neck warty, yellow beneath, with a yellow streak on each side, from the angle of the mouth and under the ear; claws elongate, acute, compressed.

11. Hydaspis Gaudichaudi. _Gaudichaud's Hydaspis._

Shell oval, oblong, truncated in front, rounded behind, keelless, brown marbled with black, and with yellow spots on the outer edge of each marginal shield. Sternum black in the middle, orange on the sides. Head large; under part of the neck orange, marbled with brown.

Hydaspis Gaudichaudi, Gray, Cat. Tort. B.M. 40.

_Hab._ Brazil. Mus. Paris (one very young specimen).

12. Hydaspis Hilairii. _St. Hilaire's Hydaspis._

Shell rather convex, pale brown, short, oval, narrowed at each end; shields smooth; vertebral broad, each furnished with a keel-like tubercle. Sternum yellow, black-spotted. Head depressed, subsquamose, muzzle short, round.

Hydaspis Hilairii, Gray, Cat. Tort. B.M. 40.

13. Hydaspis affinis. _The Allied Hydaspis._

Shell brown, obscurly black-rayed, margin strongly reflected over the hinder feet; two last vertebral shields with an elevated compressed conical ridge. Neck long, black, with a yellow line on each side, beneath yellow.

Hydaspis affinis, Gray, _D. C._ 22. no. 10, incl. ; _Cat. Tort._ B.M. 41.

Shell oval, oblong (of the same width at the two ends), rounded before, obtusely angular and nicked behind; vertebral plates forming a gutter on each side of the tubercular keel. Body yellowish, spotted and rayed with brown, beneath yellow. Head with small scales; occipital and supraciliary shields elongated.

_Hab._ South America; Buenos Ayres. Mus. Paris, two specimens, young and old.

5. _CHELYMYS._

Head and temple covered with a smooth skin. Beaks naked, horny, strong. Chin not bearded. Neck not warty. Shell convex, solid, expanded behind; side edges narrow, rather revolute; muchal shield distinct; front cavity much contracted by two rather diverging septa, only leaving a space half the width of the outer opening; vertebral column sharply keeled within. Sternum solid, narrow, with broad and shelving side wings, and a broad rounded notch behind. Claws 5'4, acute. _Australia._

Chelymys, Gray, _Cat. Tort._ B.M. 41 (1844).
Eunydras, _Bouq. Tab. Analyst._ 8 (1836).

1. Chelymys Macquaria. _The Victoria Chelymys._

Shell ovate, convex, blackish-brown marbled with grey, and rather rugose above, with slightly impressed, narrow, netted grooves; beneath convex, yellow; vertebral plates nearly square, the fourth six-sided, elongate; the marginal plates rather narrow in front, broader and slightly bent upon the sides, dilated, rather produced, and leaving two or three notches over the tail behind.

Chelymys Macquaria, Gray, _Cat. Tort._ B.M. 42.
Eunys Macquaria, _Cev. R. A._ ii. 11.
Hydaspis Macquaria, Gray, _Syn._ 40.

Gray, _Trav. W._ Austr. ii. 445.
_Hab._ Australia.

For. 1. High, convex.

Hydaspis australis, Gray in _Gray, Travels W._ Austr. ii. 445. t. 6.

_Eunydras._ _Bouq. Tab. Analyst._ 8 (1836).

_Hab._ Australia.

_Osteology:_

a. Adult (shell only). Back with a very narrow, slightly sunk, interrupted vertebral line; shield partly rugose; vertebral plates rather longer than broad. _Victoria
CATALOGUE OF SHIELD REPTILES.

River, N.W. coast of Australia. Presented by Capt. William Chambers, R.N.

Var. 2. Shell depressed, lighter; hinder margin expanded; hinder lateral marginal plates broader than long; vertebral plates six-sided, broader than long.

Osteology:—

f. Adult (shell only). Rather deformed, more depressed, and shelving downward behind. Australia. Mr. Argent's Collection.

The two varieties, though so different in general appearance, are found together in the same river. Are they the sexes?

B. Head large or very large.

Chelydide B, Gray, Cat. Tort. B.M. 36.

Emys porphyrea, Dalitz. Rept. ii. 142.

Hab. Australia; New Holland.

2. Chelodina oblonga. The OBLONG CHELODINE.

Tab. XXIV.

Shell oblong, rather contracted in front, with a broad, impressed, vertebral groove, olive-brown, with irregular anastomosing lines, beneath yellowish; marginal plates longer than broad; second larger than the first or third, and rather angularly produced in the middle of the inner edge, which is opposite the suture of the costal plates. Sternum high, flat, strongly and sharply keeled on the sides; neck warty, very thick; pectoral plate longer than broad.

Chelodina oblonga, Gray in Grey, Trav. Austr. ii. 443, 445. t. 7; Cat. Tort. B.M. 43.

Hab. West and North Australia.

d. Adult (stuffed). Port Essington.

e. Adult (stuffed). North Australia. Mr. Argent's Collection.
3. Chelodina Colliei. **Collie's Chelodine.**

Shell oblong, elongate, narrowed, revolute and contracted on the sides, dilated and bent up behind over the hind legs. Pale brown, varied and rayed with bright brown. Sternum narrow, keeled on the sides.

Hab. Swan River (A. Collie, Esq.).

a, b. Adult (stuffed). Swan River. From Haslar Hospital.

c. Very young (in spirits). Body scarcely larger than the head. Swan River. Presented by Sir John Richardson, M.D.

**Shields hard, horny, rugose.**

4. Chelodina sulcifera. **The Grooved Chelodine.**

*Tab. XXV. fig. 2.*

Shell oblong, rather depressed, dark brown; plates thin, concentrically grooved; vertebral plates convex, longer than broad; areola small, posterior; the sides rather reflexed, and rather dilated and bent up behind over the hind legs. Sternum brown; shield rather convex; sides sharply keeled; pectoral about as long as broad.

Hab. Australia.

a. Adult? (shell only). Australia. Mr. Warwick's Collection.

This species differs from *C. longicollis* in the thickness and grooved state of the plates, the small size of the areola, and the convexity and width of the vertebral plates.

7. HYDROMEDUSA.

Head elongate, depressed, covered with a soft dotted skin. Beaks narrow, exposed. Lips rather dilated and fleshy at the angle of the mouth. Chin not bearded. Neck wartv. Claws 4·4; outer toe on each foot small, clawless. Tail elongate. Shell oblong, depressed, expanded in front, slightly revolute on the sides. Nuchal plate large, placed behind the front marginal plate, like a sixth vertebral; the second pair of marginal plates large, edging the umbral plate. Intergular plate large, long, marginal. Tropical America.

_Fitz. Syst. Rept. 29._

Gray, *Cat. Tort. B.M. 43 (1844).*

Chelodina (part.), *Dum. & Bib. Erp. Gén. ii. 446 (1855); Cat. Meth. R. 21.*

*Back nodose behind.*

1. Hydromedusa Maximiliani. **Prince Maximilian's Hydromedusa.**

Shell oval, convex, entire, rounded in front, rather angular behind, pale brown, black-spotted; nuchal plate as broad as the first vertebral; the first vertebral longer than broad; the fourth costal and last two dorsal shields protuberant; forehead flat. Throat yellow, brown-marbled.

Gray, *Cat. Tort. B.M. 44.*

_Fitz. Syst. Rept. 29._

Emys Maximilianii, *Mikon, Delect. t._

Chelodina Maximiliani, *Fitz. Fezz. 48; Dum. & Bib. Erp. Gén. ii. 449; Cat. Meth. R. 21._

Hab. Brazil.

a. Adult (stuffed). Third and fourth costal and fourth and fifth vertebral plates acutely tubercular. South America; Buenos Ayres. Dr. Miller's Collection, 1848.

Var. Fifth vertebral shield with cross ridge only; hinder costal plate less prominent.

b. Adult animal (dry). The nuchal or anterior vertebral plate transversely divided in half. (Lost one vertebral plate.)

"Brazil." From the French Museum; sent under the name of *Chelodina flavilabris*.

**Osteology:**

_Wagler, Syst. t. 3. f. 2-12._

c. Shell wanting some plates; vertebral plate tubercularly keeled; fifth with a broad transverse prominence; other shields smooth. *La Plata.*

**Back with a central keel, rounded behind; shields grooved.**

2. Hydromedusa flavilabris. **The Yellow-Lipped Hydromedusa.**

Shell elongate, depressed, oval, entire, rounded in front, rather angular behind; nuchal plate rather narrower than...
CATALOGUE OF SHIELD REPTILES.

the first vertebral; hinder discl plates flat; the first vertebral broader than long; second, third and fourth vertebra blistered bluntly keeled; forehead convex. Jaws bright yellow; neck with acute warts.

Hydromedusa flavilabris, Gray, Cat. Tort. B.M. 44.

Hab. Brazils.

II. Maximiliani, jun., Gray, Cat. Tort. B.M. 44.

c. Adult (stuffed; wanting head). The anterior vertebral plate small, quadrangular, narrow in front; second very large, broad in front, narrow behind, about as long as broad; the third, fourth and fifth vertebral plates bluntly keeled; the costal plates even, the first and third rather more convex than the others near the upper edge. South America. From the Zoological Society.

*** Back not keeled, rounded behind.

3. Hydromedusa depressa. The DEPRESSED HYDROMEDUSA. Tab. XXVI.

Shell oblong, depressed, dark brown, entire, rounded in front, rather angular behind; nuchal plate short, broader than the first vertebral; first vertebral square, as long as broad, with the front lateral angle produced. Sternum pale brown; gular plates short, subequal. Head grey; lips and beneath white; neck with small conical warts.

Hab. Brazils.

d. Adult (in spirits). Some of the plates of the back and sternum divided into a number of small roundish shields. Brazil. Mr. Brandt's Collection.

d. Claws 5:1. Head flat, much depressed; beaks covered with fleshy lips; chin bearded; intergal plate marginal.

10. PODOCENEMIS.

Head convex; crown with five shields, two nasal, one frontal, large, and two temporal, with a deep groove on the forehead; cheeks with large shields. Chin two-bearded. Jaws naked, slightly arched, toothless. Eyes superior, close. Legs with some thin crescentic scales in front. The upper part of the hinder edge of the hind foot covered with three large flat shields. Toes broadly webbed, with two broad thin scales above. Claws 5-4, short, broad, flattened. Tail short, not clawed, with a diverging series of horned cross ridges on each side. Shell rather solid; sterno-costal symphysis elongate; marginal plates 12-12; canal separate. Nuchal plate none. Sternum broad, not mobile, narrower behind.

Peltcephalus, sp., Wagrler, Syst. 135.
Fitz, Syst. Rept. 29.
Gray, Cat. Tort. B.M. 25.

1. Peltcephalus expansa. The Pitipu. Tab. XXVII.

Shell oval, entire, keelless, very depressed when adult, teetiform and rather moderately keeled when young, much and horizontally expanded over the hind legs. Head broad, short; of young white-spotted.

Peltcephalus expansa, Wagrler, Syst. 135. t. 4. f. 1, 2.
Dum. & Bib. Erp. Gen. 1ii. 383. t. 19. f. 1; Cat. Meth. R. 18.

Testudines steganopodes (part.), Wagler, Syst. 133.

Potamites on Tortues fluviatiles, Dum. & Bib. Erp. Gén. ii. 461; Cat. Méth. R. 22.

Fam. IV. TRIONYCIDEÆ (Soft Turtles).

Head flattened, ovate. Eyes small, superior. Jaws horny, covered with dependent fleshy lips. Chin not bearded. Nostrils elongated into a short cylindrical trunk. Neck long, contractile. Feet short, strong. Toes 3:5:3:5 short, expanded, strongly webbed, two outer clawless. Claws 3:3. Tail short, conical, simple. Shell covered with a hard cartilaginous skin, usually expanded and flexible on the edge, the ribs only united together and to the vertebrae above, separate below. Sternum formed of a ring of bones, covered with a continuous skin, and in the adults furnished with rough calllosities on the prominent part. Pelvis only attached to the vertebrae. Living in rivers and lakes in warm climates: often lying in the mud with the head only exposed: eating fish, and rarely vegetables. Eggs spherical.

The ribs become united together for a greater proportion of their length, and the sternal calllosities appear and increase in size as the animal increases in age; hence they do not afford specific, much less generic characters.

Gymnopodi (part.), Gray, Ann. Phil. x. 212 (1825).

Geoffroy used as characters the existence and non-existence and form of the anterior vertebal bone; but all the
species of *Trionyx* have an *odd bone* ("marginal piece," Geoff.) on the margin, which is only slightly developed in the young. Geoffroy's figure of *T. eugyptiaca* is from an adult; *T. subplanus* and *T. carinatus* from young specimens; *T. javanicus* from an imperfect one, as complete specimens of this species have this bone.

Fitzinger has divided this family into the genera *Trionyx* (*granulosus*), *Aspidonectes* (*javanicus*), *Platyplectis* (*bougainvillei* and *ferox*), *Peloriscus* (*sinensis* and *labiatus*), *Amyda* (*subplanus* and *muticus*), according to the union and separation of the cervical bones and the ribs, and the rugosity and partial smoothness of the surface of the dorsal plates; but these characters alter with the age of the animals, and they separate nearly allied species and those coming from the same countries.

**Synopsis of the Genera.**

A. Sternum broad, with valves over the feet. Sterna1 callosities 7 or 9.

1. *Eryx*.

2. *Cyclamenet*.

3. *Trionyx*.

4. *Dogania*.

5. *Chitra*.

CATALOGUE OF SHIELD REPTILES.

2. Emyda Ceylonsensis. The Ceylon Dura.  
Tab. XXIX. a.

Back and upper part of the head (in spirits) dull pale uniform olive-brown; lips and lower part of the body whitish. The odd anterior sternal tubercle large, oblong, transverse; the hinder callosities large, close, nearly united in the adult, with straight parallel edges. 

Hab. Ceylon.

b. Adult (shell only). Ceylon. From the Zoological Society. Sent by Dr. Kelaart.

Dr. Kelaart described this species, probably from life, as "olive-green, with indistinct brown stripes, and minutely punctulated; beneath white or fleshy-white. Head green, black-striped; lips yellow." . . . "This Water Tortoise is generally distributed in the lower part of the island, and is found in lakes and tanks. Several we kept alive for months in a tub filled with fresh water, fed freely on animal food, and also on bread and boiled rice. A large female laid three eggs, globular, about an inch in diameter, with a hard calcaneous shell. This Tortoise too is put into wells to catch the point of scavenger." It is called Kiri-Ibba in Cingalase.

Back, head and neck (of young) grey, with minute white spots; sternum blackish, edged with dirty white.

Emyda Senegalensis, Gray, Cat. Tort. B.M. 47. 

Perhaps the young of Cyclanostetus Petersii.

2. CYCLANOSTEUS.

Head moderate, ovate. Margin of the dorsal disk not supported by bones. Sternum broad, rounded before and behind, with a moveable flap over each foot. Sternal callosities 9, viz. four pairs, and an odd one behind the two anterior pairs; the pair on the hinder lobe small, far apart.

Cyclanostetus, Peters, MSS. (1818).

Tab. XXIX.

Shell broad, rounded before and behind; sternal callosities 9.

Hab. W. Africa; Gambia.

Osteology:—

2. Cyclanostetus frenatus. The Bridled Cyclanostetus.

Face black-lined.

Cyclanostetus frenatus, Peters, MSS. (1848).

Casi, Native of Mozambique.

Hab. Mozambique (in fresh water); River Zambia, (Peters).

B. Sternum narrow at each end; margin of the shield expanded, thin, flexible. Sternal callosities 4. Tri-onychina.

Amyda, Bonap. Tab. Analyt. 10 (1836).

Aspidonectes, Wagler, Syst. 134 (1836).

Fitz. Syst. Rept. 30.

Trionyx, sp., Bell?

§ Head moderate; face conical; eyes lateral.

3. TRIONYX.

Head rather large, ovate, dilated behind. Muzzle rather elongate, conical. Lips thick. Shield flexible on the edge. Ribs 8:8. Sternum narrow at each end. Sternal callosities 2 or 4; the lateral one occupying part of both lateral sternal bones.

Trionyx, Gray, Cat. Tort. B.M. 49 (1844); Ann. Phil. x. 212 (1825).

Platyplepis, Fitz. Syst. Rept. 30.

Aspidonectes a, sp., Wagler, Syst. 134.

Aspidonectes b, Wagler, Syst. 134.

Aspidonectes, Fitz. Syst. Rept. 30 (1843).

I had divided the American from the Old World species, believing they had only seven ribs, but on re-examination I find they both have the same number of ribs.

The species may be thus divided according to their osteological characters, but they can only be used with certainty by those who have a series of specimens of different ages of each species before them.

* First vertebral bone broad, crescent-shaped, early developed; episternal bones rather far apart at the base.

+ Callosities 2; dorsal disk with two pits in front, one on each side of the first vertebra.

1. Trionyx Raféht.

++ Callosities 4; dorsal disk with two pits in front.

2. T. Argus.

+++ Callosities 4; dorsal disk without any pits in front.

** First vertebral bone oblong, not developed until late in life; episternal bones elongate, close together at their base. Callosities 4.

They may be divided according to the colouring of the head and limbs, but these colours often disappear or become indistinct in the adult animal.

* Head and limbs with subequal white spots.

** Head and limbs with small and some larger white spots.

*** Head spotted with longitudinal narrow black lines; lips and chin spotted.

**** Head with diverging black streaks on the crown.

***** Head with black-edged streaks enclosing the eye.

The young of T. Niloticus, T. Gaugeticus, T. Javanicus, T. perocellatus and T. ferox have the spinous tubercles on the back in numerous parallel lines; T. perocellatus has them in distant, rather irregular lines; and Chiton Indica has close, isolated, rounded tubercles, very much crowded together on the nape; the side and hinder part of the disk smooth.

* Asiatic.

1. Trionyx Raféht. The Raféht. Tab. XXX.

Dull green. Head white-dotted. Sternal callosities 2; lateral transverse, rather dilated at the inner end; anterior sternal bones far apart; anterior part of the disk with two rounded cavities between the broad lunate first and the second vertebral bones.

Tyrse Raféht, Gray, Cat. Tort. B.M. 49.

Shaw, Misc. t. 907.

Testudo Euphraticus, Daud. Rept. ii. 305.

Gray, Syn. 48.

a. Adult (stuffed). Euphrates. Presented by Mr. Loftus, Euphrates Expedition, 1850.

Osteology:—

Skull of "a." Euphrates.

The skull is much shorter and broader than that of T. Niloticus.

2. Trionyx perocellatus. The Eyed Boulousse. Tab. XXXI.

Back of young with distinct irregular lines of tubercles, with six obscure spots. Head and neck olive; lip and chin with small white spots, with narrow brown streaks from the front of the eyes to the lip, and from the back of the eyes across the temple; anterior dorsal bone large, broad. Sternal callosities 4; hinder oblong, trigonal, oblique, with the rugosities in concentric oblong rings.

Trionyx perocellatus, Cantor, Ann. & Mag. Nat. Hist. T. tuberculatus, Cantor, MSS.

Hab. China; Chusan.
CATALOGUE OF SHIELD REPTILES.

e. Adult (stuffed). Disk 7 inches long, with two very small pits in front. China.

f. Young (in spirits). The head in spirits lead-coloured black, black-dotted, with a narrow black streak on the forehead from the front of the upper part of each eye, and a narrow black streak from the lip through the eye and extended on the sides of the nape. Throat whitish, marbled with blackish. China. Dr. Berthold Seemann. Tan. XXXI. From Haslar Museum.

This species differs from Trionyx carinatus in wanting the regular series of tubercles forming a keel on the back of the dorsal disk.

Mr. Seemann’s specimen has the markings on the head very like those of a young stuffed specimen of T. ferox from North America which we received from Mr. W. Smith; but the streak from the back of the eye in the American species is double, that is to say, pale, with a black edge on each side.

This species may always be known in the young state by the scattered and irregular distribution of the dorsal tubercles.

3. Trionyx Gangeticus. The Kaahey.

Olive, vermicated with dark brown (when young, with four or five large eyed spots). Head olive, white-dotted, with a yellow spot (white in spirits) behind each eye, at the angle of the mouth and on each side of the chin, and one on each side of the neck below the cheek.

Tyasse Gangeticus, Gray, Cat. Tort. B.M. 47. Trionyx gangeticus, Cer. R. A. ii. 16; Guérin, Icon. t. 1. f. 6, young.

a, b, c. Young (in spirits); 4 inches. Back with four black spots. India; Ganges.

d, e. Young (in spirits); 4 inches. Back with four large and two small posterior black spots. India; Ganges.

f. Very young (in spirits). Marks on face and spots on back very distinct. India. Mr. Argent’s Collection.

OSTELOGY. Tab. XLIII. fig. 1, skull.

Trionyx du Ganges, Cer. Oss. Foss. v. 187. t. 11. f. 5, 8, skull; t. 13. f. 42; t. 12. f. 46, sternum.

g, h. Dorsal disk, vertebra and ribs only. Nepal. Presented by J. B. Hodgson, Esq.

t. Dorsal disk, vertebra and ribs only. Nepal. Presented by H. Falconer, M.D.

k. Skull (half-grown; imperfect). India.

l. Dorsal shields and sternum. India. From the Zoological Society.

These bones (g, h, i and l) may all possibly belong to T. Javanicus, as they were procured without any head or other characteristic parts.

"The young (Testudo ocellatus, Buc. Hamilton, MSS.; Gray, Illust. Ind. Zool. t.), as the head above pale olive, with a large yellow spot between the eyes and a similar one behind each eye; neck, limbs, and posterior margin of the shell dark olive, with paler round spots. Shell olive, with black irregular lines and four or five central ocelli, black in the centre, edged with red, round which a black ring. Sternum pale whitish olive."

In the transition state, being about changing the livery (Testudo Hurum, B. Hamilton, MSS.: dark olive-green, vermicated and spotted with light olive-brown; beneath greenish-white.

"It is of fierce habits, desperately defending itself by biting, and emitting, when excited, a low, hoarse, cackling sound."—Cantor.

The largest specimen Dr. Cantor observed at Pinang measured as follows:—Head 4; neck 4½; shell 23; tail 5 inches.

Tab. XXXII.

The front edge of dorsal disk tubercular; the hinder part of the disk with a central keel, continued by a central series of close triangular acute tubercles. Olive. Head large; two front sternal bones very elongate, produced; the anterior vertebral bone rudimental. Sternal callosities — ?

Hab. Moluccas.

Trionyx, n. s., Mus. Leyden.

b. Testudo alba, Bodff. Epist. iii. 21.

c. Half-grown (in spirits). Olive, with small round dark spots; the larger spots in three series, one down the vertebral line, and the others in the middle of the sides. Head dark above and below, symmetrically white-spotted, the spots of the occiput and those of the chin larger, and with a very large irregular white spot at the side of the neck; back of neck and feet white-spotted. Amboina or Ceram. Madame Ida Pfeiffer's Collection.

d. e. Young (in spirits). Olive, with small round dark spots; the larger spots in three series, one down the vertebral line, and the others in the middle of the sides. Head dark above and below, symmetrically white-spotted, the spots of the occiput and those of the chin larger, and with a very large irregular white spot at the side of the neck; back of neck and feet white-spotted. Amboina or Ceram. Madame Ida Pfeiffer's Collection.

f. g. Young (in spirits); like d and e. Mr. Bartlett's Collection.

Ostleology —

b. Half-grown skeleton; anterior vertebral bone not developed. Java. From the Leyden Museum.

Trionyx stellatus, Mus. Leyden.

The specimens of this species are larger than the stuffed example of T. Javanicus, but yet they have no appearance of any sternal callosities.

5. Trionyx frenatus. The Bridled Bouleusse.

Olive-brown (in spirits). Back with numerous close lines of small tubercles, two central parallel, the others rather irregular. Head brown, with a dark streak on the forehead, divided behind the eyes into three broad indistinct diverging streaks, and one from the lips at the base of the proboscis through the eyes to the sides of the throat; lips brown, pale-spotted; throat pale brown, sides of the neck whitish. Sternal callosities 4, small.

b. Half-grown female (stuffed). It contained many full-sized eggs; the sternal callosities are only very slightly developed. Singapore. Mr. Wallace's Collection. This species is very like Dagona subplana, but the head is smaller and brown-lined, and there are indications of four sternal tubercles. The ribs are narrower, and the ends of the ribs are nearer the front side of the dilated part, and not in the centre, as in our specimen of D. subplana. The rudiments of the sternal callosities are on each of the two lateral sternal bones, while in Dagonia they are only found on the anterior pair.

The young specimen was named Trionyx Javanicus by M. Bibron, but the head was then entirely contracted into the shell, so that only the tip of the nose could be seen. It differs from that species in the position of the dark streaks, and in their being much less distinctly marked.

The front and hinder edge of the dorsal disk tubercular. Olive-green; crown of the head with one central and two radiating black lines; two front sternal bones elongate, produced.

a. Half-grown (in spirits); 5½ inches. India.

b. c. Young (in spirits); not eyed. India.

d. Half-grown (stuffed). Back with irregular rugose ridges; anterior bone separate; lateral sternal callosities contracted in the middle; hinder oblong, oblique. India; Deccan. Presented by Colonel Sykes, F.R.S.

e. f. Very young (in spirits); not good state. China. Presented by W. Baird, M.D.

y. b. i. Very young (in spirits). Back eyed. India.

j. Very young (dry skin). India.

k. Half-grown (stuffed). First vertebral bone slightly developed. India; Capt. Boys' Collection.
CATALOGUE OF SHIELD REPTILES.

2. Adult (stuffed). The first vertebral bone united to the other, forming one disk; head with seven black diverging rays. India. Capt. Boys' Collection.

"Very young: above olive-green; the head and upper part of the neck with numerous small white spots, becoming larger and more distant on the cheeks and chin; on the vertex two round black spots, on the occiput two diverging black lines. The shell with several large black, white-ringed spots, between which numerous smaller indistinct white spots; margin pale white; several longitudinal ridges composed of close minute tubercles: beneath greenish-white. Older: above uniform olive green; the longitudinal ridges of the shell consist of tubercles more distant and proportionally smaller than in the young." — Cantor.

This species is numerous in ponds and rivers in Phanang. The largest that Dr. Cantor observed measured as follows:
- Head 2 2/3; neck 2 1/2; shell 6 3/4 inches; tail 3/4 of an inch long. Eaten by the Chinese.

** African.

Shell rather convex, vertebral line often depressed; back green, spotted with white or yellowish. Callosities 4, far apart, lateral, dilated internally, hinder triangular; first and second vertebral bones united by a smooth suture.

**Platypeltis ferox, Fitz. Syst. Rept. 30.**

**Hab.** North America; Georgia and Florida; New Orleans.

e. Adult (stuffed). North America. Presented by the Royal Society. The specimen described and figured by Pennant (re-stuffed).

c. Young (in spirits; bleached). North America. Mr. Frank’s Collection.

**Trionyx ocellatus, Levaire, Weed, Vog. Amér. Sept. iii. 242.**

**Trionyx annulatus, Weed, Vog. Amér. Sept. iii. 242.**

Of all the animals of the family of Chelonides, they furnish the most delicious and nourishing food.—Leconte.

M. Wagler separates **Trionyx carinatus**, Geoff., into a section of his genus **Aspidonectes** distinct from **T. ferox**, and he regards **T. ferox**, **T. muticus** and **T. spiniferus** as three species.—Syst. 134.

In these three specimens (e, f, g) there is a greater space between the inner ends of the lateral callosities than in the one described by Pennant, but this may probably arise from their not being quite so adult.

The following species are very doubtful. The first appears to depend on a badly observed young specimen, and the latter most probably arises from the error of the artist and the describer.

10. **Trionyx muticus.** The **Unarmed Trionyx.**

Thorax much depressed, without any spinous tubercles on the front edge.

**Trionyx muticus, Levaire, Mus. Mus. xv. 257. t. 7.**

**Holbrook, N. A. Rept. ii. 19. t. 2.**

Fam. V. CHELONIAE (Turtles).

Head globose, shielded; nostrils rather tubular. Beaks horny, naked. Neck short, subretractile. Feet very long, not retractile, compressed, fin-shaped; toes depressed, expanded at the end, and often armed with flat claws; front feet longest. Tail short, thick.

Shell low, cordate, with a defined bony margin, covered with horny shields or a leathery skin. Ribs free at the end. Sternum ring-like, cartilaginous in the centre, and only united to the thorax by a cartilaginous suture.

Seas of torrid and temperate zones; some eating algae, as Ch. Midas, which are used for food, and imported as a luxury; others, molluscs and radiated mummies, as Ch. Ca-
retta, only collected for their oil. The horny shields are used for ornamental purposes.

CATALOGUE OF SHIELD REPTILES.

c, d. In spirits (young).

Rondeletius (De Pisc. Mar. 451) thought that it was from the bones of this animal that the ancients formed their lyres, and for this reason it was called the Luth by Lacépède; but the remains of the Greek lyre in the British Museum are evidently formed from bones of Testudo graeca.

A skull labelled T. coriacea, from the Pacific Ocean, presented by Mr. Collie to the Haslar Museum, is so like that of C. Midas, as not to be distinguished from it; the hole of the ear appears rather rounder than in the other skull, but very slightly so.

b. Shell covered with horny shields. Cheloninæ.

* The inner surface of the upper and lower jaws simply concave; shields thin, rather membranaceous, brittle. Young three-keeled.

2. CAOUANA.

Thorax ovate, cordate, covered with fifteen thin, truncated, not imbricated shields, which are keeled in the young. Head large. Jaws slightly curved towards each other at the tip; side of the lower jaws covered with angular plates. Marginal plates 27 (rarely 25). Carnivorous, eating mollusca and crustacea.

Young three-keeled.

The additional pair of discal shields occupies the side of the narrow first vertebral shield, the three covering the space occupied by the broad front vertebral shield of Chelonia.

The skull (Curt. Obs. Foss. t. 11. f. 1–4) broad, short; forehead flat, shelving, with the nose on the slope of the face; the inner surface of the bones of the jaws smooth (the ridges being on the horny sheath). The pterygoids are broad, concave, with a deep diverging groove on each behind, edging the very narrow linear ridge-like triangular part of the body of the sphenoid, which has part of the basiary between it. Last vertebral bone narrow, elongate, thick-keeled, of nearly the same width the whole length.

The outer edge of the pterygoid bones is produced into a lobe in the middle; this lobe appears to diminish in size as the skull reaches adult age.

The frontal (Curt. Obs. Foss. t. 11. f. 2 f) does not appear to increase in size so rapidly as the other bones, being larger in comparison in the young than in the adult skulls.

1. Caouana Caretta. The CAOUANNA or LOGGERHEAD.

Claws two on each foot; back convex, rounded, toothed behind; vertebral plates six-sided, keeled, rather longer than wide; caudal plate squarish, longer than broad, hinder marginal plate rather wider than the rest; costal shields of young keeled above.

Young black; back three-keeled; central highest.

Hab. Atlantic Ocean; Azores; Messina; Morea; Martinique; Rio Janeiro.

CATALOGUE OF SHIELD REPTILES.

Hab. Indian Ocean; Malabar; Philippines.

a. Very young (in spirits). Dark brown; neck, fins, and under side paler brown; without any narrow anterior vertebral plate (the two united?). Philippine Islands.

b. Stuffed (adult). With a narrow anterior vertebral plate.

"Young. Above blackish-olive, lighter than in the adult; shell and fin edges with pale yellow. Sternum pale greenish-yellow, washed with chestnut; areola blackish.

"Adult. Head brown; shell blackish-green, some of the marginal scales of the fins yellow. Sternum yellow, washed with chestnut; 27 marginal shields; fin with one nodule.

"The shell is broad, subcordiform, its length exceeding its breadth by 1/4, three-keeled, the vertebral keel strongest, dentated behind; marginal shields 27, obliquely placed, the first and fourth pairs of costals and the fourth vertebral shield each divided into two pieces.

"The flesh of the Chelonias olivacea, though relished by the Chinese settler in Penang, is unpalatable to Europeans."—Cantor.

Shell elongate, rather flattened in the middle, convex on the sides, and slightly dilated and flattened upon the side and contracted on the hinder edges; marginal plates 27, last pair much longer; caudal plates square, large, much longer than broad; vertebral plates elongate, six-sided, half as long again as broad. Claws ——? Head ——?

Caouana elongata, Gray, Cat. Tort. B.M. 53.

Hab. —— !

a. Shell only (adult).

** The inner surface of the jaws with an angular subcen-
tral ridge on the upper, and a sharp ridge on the inner edge of the lower one. Shields thick, horny, brittle, imbricate. Young three-keeled.

3. CARETTA.

Thorax ovate, cordate, three-keeled, covered with 13 thick, horny, keeled plates, which are produced and imbricate on their hinder edge. Muzzle elongate, compressed. Beaks moderate, upper edge straight, toothless, lower slightly recurved; side of lower beak with a single elongated shield. Sternum keeled on each side. Fins each with 2 claws. Palate concave, broad, narrow behind; front of upper jaw with a single central ridge; lower concave, with rather strong ridges on the inner edge. The last vertebral bone broad, short, half-ovate, about as long as wide at the base.

Osteology:

c. Half-grown (upper shield only).
d. Lower shield of young.
e. Skeleton. The Paris Museum.
f. Adult (upper shield only). Back of Baru Island.

Head brown, scales edged or rayed with yellow. Shell yellow, marbled or rayed with rich brown. Sternum yellowish-white.

"In the young the areola of the sternal shield black."—Cantar.

"The Caret or Hawkbill Turtle is called Kookreeloo or Koosoombboo by the Cingalese. It is caught on the southern coast of the island (Ceylon), and is very abundant at Point de Galle and Matura. It is rare on the northern part of the coast. Some specimens are sold for as much as £1; the price depends on the quality of the shell (shields). It is said that the natives remove some of the shields while the animal is alive, and return it to the sea; the shields are said to be reproduced, but for the truth of this we cannot vouch. The natives eat the flesh of this Turtle, but it is unpalatable to Europeans."—Kelaart, Reptiles of Ceylon, 181.

*** The inner surface of the upper and lower jaws with an acute ridge, concentric with the outer edge of the upper and inner of the lower jaw. Shield horny, thick, not imbricate. Young not keeled.

Discal shields 13, not imbricate, truncated behind. Muzzle short, rounded. Jaws moderate, upper slightly notched in front, and feebly toothed on the side, lower dentilated, with a single elongate plate upon each side. The front toe of each fin clawed. Feeding on algae.

Hab. Indian Seas; Cape of Good Hope; New Guinea.

OSTEOLOGY:

c. Half-grown (upper shield only). Vertebral shields rather longer than broad. South America?
h. Adult. Upper shield very dark-coloured.
g. Half-grown skeleton.

Young? Black or greenish-olive; chin, under side, broad edge of shell and fin, and the base of the hinder fin, white.
c, d, e. Very young (in spirits).
f, g, h. Very young (in spirits).
i. Very young (stuffed). From the Zoological Society.

Young. Head, shell and fins greenish-black; margin of the shell and fins and sternum white.

Adult. Head and fins chestnut, scales edged with yellow. Shell greenish-yellow, with chestnut rays and spots. Sternum gamboge or greenish-yellow.

This species, the 'Tinyu' of the Malays of Pinang, is at all seasons plentifully taken in the fishing stakes in the Straits of Malacca, and is the 'Green Turtle' of the European inhabitants of our Malayan settlement and of the seaports of India. In size it equals Chelonia Midae, Schweig. (of the Atlantic), which it rivals in flavour. About December and January is the season when the female deposits her eggs in the sandy beach of some sequestered island, and then the fishermen watch during the moonlight nights to 'turn turtles.' The eggs are of a spherical shape, about one inch in diameter, covered with a soft hemi-transparent membrane of a pale yellowish colour. The expert eye of the fisherman baffles the pains with which the turtle conceals her eggs, and prodigious numbers are disinterred. They are very rich-flavoured, like marrow, and will keep for weeks although exposed to the air."—Conotr.

"The breadth of the fronto-nasal shield in Chelonia virgata is only one-third of the length, whereas in Chelonia Midae it is one-half; and these proportions appear to be constant in all ages of the two species. The very young of both greatly resemble each other in colour and shape. Six living young were all of the following dimensions:—

Head \( \frac{1}{3} \); neck \( \frac{1}{2} \); shell \( 2 \); tail \( \frac{1}{2} \) of an inch; and they presented the following peculiarities:—

"The shell cordiform, the length exceeding the breadth by one-eighth; the second vertebral shield much broader than the first, and altogether the largest of the series; the second costal shield larger than the third; the breadth of the fronto-nasal shield one-third of the length. Each fin with a single claw."—Conotr.

"This Turtle (Chelonia virgata) is found all round the island (Ceylon), and is very numerous in the Trincomalee Harbour for several months in the year; a good-sized one can be bought for 6d., a very large one for 1s. 6d. to 2s. The flesh of this Turtle is not far behind in flavour that of the well-known Green Turtle (Chelonia Mydas), so famous for making the Turtle soap. The female lays from 100 to 200 eggs of a globular shape, with a soft semitransparent calcareous shell, which are much prized as articles of food by natives and Europeans. A native will consume as many as 20 or 30 eggs at one meal, and we have seen Europeans eat a dozen for breakfast."—Kelaart, Reptiles of Ceylon, 181.

++ The vertebral bones behind the last rib narrow, linear or cone-shaped, attenuated behind.

Chelonia §§, Gray, Cat. Tort. B.M. 54.
Chelonia, Fitz. Syst. Rept. 50.

Shell subrotundiform, rather elongate, olive-green, when
dry fulvous, with brown spots; back rounded; vertebral shields hexagonal, nearly as long as broad.

a, b. Half-grown (stuffed). Brazil.

**Osteology:**

Testudo mydas, Spix. Cephal. t. 1. f. 5; t. 2. f. 5, skull.
Caretta, Bojanus, Parergon, f. 192-195.

C.
Head, with the shields.

D.
Skulls of adult; weighed 375 lbs. Presented by — Wauds, Esq.

E.
Skulls of adult. Imperfect; discoloured.

**Young?** Blackish-brown, keeled; chin, under surface and narrow edge of shell and fins brownish-white.

l. Very young (dry).

The skulls differ considerably in the convexity of the forehead, and they offer two distinct peculiarities, which may indicate two species or the two sexes.

In one form, of which I have examined four skulls of different ages, the width at the condyles of the upper jaw is the same as the distance from the edge of the vertebral condyle to the front edge of the palatine opening.

In the other variety, of which I have examined five, all adult, skulls, the width of the condyles of the jaw is considerably more (half an inch) than the above-named distance. In the Chelonia caretta the width of this part is very much greater than the space above named.

I may observe that in the youngest skulls of the first variety the condyles are narrowest, so that part of this difference may depend on the age of the skulls, which appear to become broader and shorter as they become older.
APPENDIX.

Page 3, add—

Mr. John Lecoute proposes a new arrangement of the Order into four great families. He observes: "I owe this arrangement in a great degree to the suggestions of my son."

Fam. II. Pedes compressi, ungulati. Sternum scuto singulo (abdominali) alato, alarum marginibus non inflexis.

B. Sternum plus minus mai- vel bivalve; osse episternali maximo entosternali obsolete (in pullis rudimentalibus) alis a scuto abdominali solum projectis. 1. Kinosternon.

Fam. III. Pedes ungulati, plerunque compressi. Sternum scuti duobus alatis (pectorali abdominali) alarum marginibus, excepta Cistulinae forterior inflexis scuti caudalibus duobus distinctis.

1. Manouria fusca (p. 15), add—

"Upper jaw with three rows of serrated teeth; the lower with two, the outer one the finest. Toes and claws 5 + 5; fore claws long and rather sharp; hind feet elavate. Claws nearly globular, the innermost one wide and flat, the edge rather sharp.

"Inhabits Java; and must from its shape be terrestrial in its habits.

"It possesses a strange mixture of the characters of this family with those of the next."—Lecoute, l. c. 187.

Geoclemys Seba (p. 18).

Dr. Kelaart believes that Geoclemys Seba (p. 18) is the young of Emys trijuga (p. 20), the difference in the form of the shell and the spotting on the head depending on the age of the specimen. I have never seen the young E. tri- jug, the adult G. Seba, nor any specimens in an intermediate state of growth. I may observe that the fore feet of Emys trijuga show its affinity to the genus Geoclemys, though the skull is that of an aquatic Emys.

16. Emys Holbrooki (p. 25), add—

a. Adult (in spirits). North America; Mississippi. Mr. Bradt's Collection.

The lower jaw rather flattened.

To doubtful North American Emys (p. 28), add—

24*. Emys nigra.

"Shell oblong ovate, slightly compressed at the sides and emarginate, but not distinctly serrated posteriorly; intero-posterior marginus of carapace everted; uchul plate narrow, truncate anteriorly, broader posteriorly; 24 marginal plates, the two posterior more or less quadrilateral, the two adjoining pentagonal. Colour blackish above, the upper part of the head and neck presenting numerous very small yellow spots upon a black ground; anterior extremities with a tinge of yellow; under jaw and throat yellow, with dark-coloured markings; plastron yellow in the middle, with large blotches of black and dark brown at the sides and
26. Emys geographic^ (p. 29), add—

b. Adult (in spirits). Head with symmetrical concentric yellow lines; frontal streak distinct; temporal spot triangular, distinct. Shell olive, with several rather irregularly disposed irregular-shaped narrow pale rings, united anastomosing pale lines on each shield; the marginal plates with anastomosing angular narrow lines; back bluntly keeled, the keel becoming narrower and more continued behind. Sternum yellow, with a dark margin to the inner edge of the hinder shields, and dark edges to the sterno-costal symphysis and the axillary and inguinal plates; the under side of the margin yellow, with a small oblong annulated spot on the hinder outer angle of the shield, and a small arched streak on the outer part of the frontal edge, completing the outline of the spot on the preceding shield, so as to render the spot subsaturated, thus showing a passage to the species of the preceding division. North America; Lake Champlain. Mr. Brandt's Collection.

"Clemmys reticulata, Dom. & Bib."

This specimen agrees with Dr. Holbrook's figure of Emys geographic^.

27. Emys pseudogeographic^ (p. 29), add—

d. Half-grown (in spirits). The markings on the dorsal shield indistinct until the shields are removed. Sternum dark varied, and with broad dark margins to the shields; the lateral processes and the sterno-dorsal symphysis with dark-edged pale irregular streaks. Head and throat with numerous narrow crowded black streaks. North America; Mississippi. Mr. Brandt's Collection.

"Emys geographic^, Fitz."

30. Emys rugosa (p. 31), add—

e. Adult (in spirits). Head olive-dotted and vermiculated with black, with a broad unspotted streak from the back of the orbit over the temple; throat blackish streaked. Shell olive above, bright red beneath, with a broad black edge to all the plates; the costal plate rugose; the under side of the lateral marginal plates with an indistinct squarish ring round the marginal band, on the suture of two neighbouring shields; legs olive-green, handless; webs very large, scaly; claws elongate, subulate, nearly straight. "North America; Mississippi." Mr. Brandt's Collection. (Dec. 1855.)

31. Emys scabra (p. 31).

The colouring of the head of this species slightly varies.

There are two living in the Zoological Gardens:—

1. The spot before the eyes and the streaks on the back of crown and nape broad and continuous.

2. The spot in front of the eyes very narrow, linear and transverse; the streak on the crown and nape narrow, interrupted in front so as to leave a spot in front of it, and with a small pair of narrow diverging streaks behind the others on the back of the neck. (Dec. 1855.)

2. Chrysemys Bellii (p. 33), add—

a. Adult (in spirits). Lateral angles of the vertebral plates central; back olive, speckled and vermiculated with black lines, with a short subsymmetrical black-edged pale line near the centre of each discal shield. Sternum black-varied. North America; Mississippi. Mr. Brandt's Collection.

"Emys marmorata, Wagler."—Brandt.

b. Adult (in spirits). Like former, but sternal mark more indistinct. North America; Mississippi. Mr. Brandt's Collection.

"Emys Oregonicus, Fitz."—Brandt.

3. Pseudemys serrata (p. 34).

Shell of live animal dark; the costal shields divided in half by a broad transverse red band, rest subanualted. Under side bright red, as figured by Holbrook. Very active and vicious. Zool. Gardens. (Dec. 1855.)

M. Leconte regards Emys serrata, Say, E. rubicencris, Leconte, E. irigata, Dunéril, and E. rugosa, Shaw, as synonyms of the same species, observing that it varies very much, but the essential character is the dentation of the jaws.

M. Leconte considers, certainly erroneously, Emys ornata and E. annuliferus as synonyms of E. hieroglyphica of Holbrook.
M. Leconte erroneously considers the variety C. Blundingtonii of Holbrook as synonymous with Lutremouys Melan- gris, a European species.—*Journ. Acad. Philad.*, vii. 189.
M. Leconte, not having seen C. Mexicana, refers it as a variety of C. Carolina with doubt.

14. KINOSTERNON (p. 43).
In the *Proceedings of the Academy of Natural Sciences of Philadelphia* for 1854, vol. iii. no. 5. p. 183, there is a paper by John Leconte, entitled "Descriptions of Four Species of Kino sternon," read on the 31st October 1854. The genus is divided into three groups, thus:—

I. Consisting of those with bivalve sterna; the valves joined to the abdominal piece by ligamentous hinges.

II. Anterior valve of sternum joined to the abdominal portion by a ligament and partly by a suture, the posterior by suture only; wings tolerably long, with a deep divided groove on the anterior part.

III. Sternum narrow, subcruiform; valves joined to the abdominal portion of the chest by sutures, the lateral teeth of which are so large as to admit of but little motion, especially in the posterior one; wings long and narrow, without any groove on the inner part. Tail unarmed.

As I have not seen the species here described as new, I can give no opinion on their distinctness. *K. Pennsylvaniaeum*, from the description of the young, is evidently the species I have described under that name, but the other descriptions do not appear to be intended for the new species I have described; at least the characters on which I have founded the species are not observed.

*K. guttaturn*, which is described as subcruinate, is evidently not the *Aromochelys carinatum* of this work.
M. Leconte considers *K. Doubledegyii*, from the description given, to be a distinct species.
