entw.

I have collected only one specimen of "*Amyda schlegelii*" from a river of the mountain Laoshan; as it presents a series of highly characteristic particularities, it deserves a special mention; if it is not a particular subspecies, it may be an interesting aberrant specimen. Those characteristics are as follows:—a wide and short snout; the head, neck and legs are greenish-grey.

On the neck and legs there are many yellow spots.

The head, underneath and on the sides bears bright orange spots. The Carapace is black greyish. Plastron, tail and legs, underneath, are pale.

Sauria.

Famille Agamidae.

GENRE *Phrynocephalus*.

All the specimens of this genus were collected by F. E. Licent, near Tch'ang tch'uan pou (in Mi tcheu hien, N. Chansi) on June, the 6, 1932.
