ABSTRACT. – This is our fifth annual compilation of an annotated checklist of all recognized and named taxa of the world's modern chelonian fauna, documenting recent changes and controversies in nomenclature, and including all primary synonyms, updated from our previous four checklists (Turtle Taxonomy Working Group 2007b, 2009, 2010; Rhodin et al. 2008). We continue to provide an updated comprehensive listing of important aspects of taxonomy, names, distribution, and conservation status of all turtles and tortoises of the world. We strive to record the most recent justified taxonomic assignment of terminal taxa in a hierarchical framework, providing annotations, including alternative possible arrangements, for some recently proposed changes. We provide common English names and detailed distributional data for all taxa, listing occurrence by countries and many smaller political or geographic subunits (states or regions), including indications of native, extirpated, and introduced (modern or prehistoric) populations. We also include current published and draft IUCN Red List status determinations for all turtles, as well as CITES listings. The diversity of turtles and tortoises in the world that has existed in modern times (since 1500 AD), and currently generally recognized as distinct and included on this checklist, now consists of 330 species. Of these, 57 are polytypic, representing 125 additional recognized subspecies, or 455 total taxa of modern turtles and tortoises. Of these, 8 species and 2 subspecies, or 10 taxa, are extinct. As of the current IUCN 2011 Red List, 134 turtle species (58.8% of 228 species listed, 40.6% of all species) are officially regarded as globally Threatened (Critically Endangered, Endangered, or Vulnerable). We now record additional draft Red List evaluations of the 102 previously “unevaluated” species, and updated draft re-evaluations of previously listed species, allowing us to evaluate the overall current threat levels for all turtles and tortoises. Of the 330 total species of turtles and tortoises, 149 (45.2%) are Threatened, with 98 (29.7%) Critically Endangered or Endangered. If we adjust for predicted threat rates of Data Deficient species, then 52% of all turtles are Threatened. If we include Extinct in the Wild and Extinct species, then 48.0% of all modern turtles and tortoises are recorded as either already extinct or threatened with extinction, with a predicted rate of 55% threatened and extinct. Turtles are among the most endangered of the major groups of vertebrates, surpassing birds, mammals, cartilaginous or bony fishes, and amphibians.

KEY WORDS.—*Reptilia, Testudines, turtle, tortoise, chelonian, taxonomy, nomenclature, genera, species, subspecies, primary synonyms, suprageneric hierarchy, systematics, common names, distribution, introduced species, conservation status, IUCN Red List, CITES, threatened species, extinction*

The diversity of all turtles and tortoises (chelonians) in the world that has existed in modern times (since 1500 AD), and currently generally recognized as distinct by specialists in turtle taxonomy and systematics, consists of approximately 330 species, of which 57 are polytypic, with

125 additional recognized subspecies, or 455 total taxa of modern chelonians. Of these, 8 species plus 2 subspecies, or 10 total taxa, of tortoises and freshwater turtles have become extinct since 1500 AD (see Table 1), leaving us currently with 322 species and 123 additional subspecies,

or 445 total taxa of living turtles and tortoises. Of all living turtle taxa, 7 species are marine turtles, leaving 315 species and 438 total taxa of modern living freshwater and terrestrial turtles and tortoises.

The 455 total turtle and tortoise taxa recognized on this checklist are based on a listed synonymy of 1206 separate named turtle and tortoise species and subspecies, counting both new descriptions and *nomina nova* replacement names, but not *nomina nuda* or *ex errore* typographical error names. In this checklist we present a full taxonomic listing of all recognized taxa, including synonymized names, and provide annotations concerning recently described new taxa, nomenclatural and taxonomic updates, and significant taxon-related controversies or developments.

New names added to this 2011 checklist are *Gopherus morafkai* Murphy et al. 2011, *Testudo dagestanica* Chkhikvadze et al. 2011 (= *Testudo graeca ibera* or *T. g. armeniaca*), and *Terrapene putnami* Hay 1906 † (= *Terrapene carolina major*).

As there is always some disagreement among experts as to which taxa are distinct and valid, and at what systematic level or rank (species or subspecies), these numbers are variable depending on the authorities presenting their data or interpretations. For prior discussions and listings of all recognized modern turtle taxa, with extensive annotations regarding areas of recent taxonomic change, instability, or controversy, see the previous publications by the Turtle Taxonomy Working Group (TTWG 2007a,b, 2009, 2010), Rhodin et al. (2008), and the turtle checklist produced for CITES by Fritz and Havas (2007). The latter is also an excellent source for full synonymies, including *nomina nuda*, *ex errore* names, and type localities.

The Turtle Taxonomy Working Group (TTWG) functions under the auspices of the IUCN/SSC Tortoise and Freshwater Turtle Specialist Group (TFTSG), which operates under the umbrella of the IUCN (International Union for Conservation of Nature) and its Species Survival Commission (SSC). Our checklist of modern turtle taxa was first compiled by the TTWG (2007b), and has since been updated annually to reflect more recent changes as required by subsequent publications with taxonomic novelties or proposed changes, as well as adding primary synonyms for all recognized taxa (Rhodin et al. 2008; TTWG 2009). This checklist is the 5th installment in this series and is current through 19 December 2011.

This list includes all primary description names, synonyms, and *nomina nova* that we are aware of, but excludes *nomina nuda* (with a few exceptions), typographical *ex errore* names, and subsequent usage and new combination names. Original and synonymized taxon names (including higher-category names) are listed using their original spelling and genus-species combination as used by the author at the time of first publication of the name. Our synonymies for genus- and species-level taxa follow, to our best efforts, the strict and established nomenclatural rules established by the International Code of Zoological Nomenclature (ICZN 1999).

However, for the higher-level suprageneric categories used in this checklist, we have also provided some synonyms and previously-used names for the same or included groupings whose usage may not necessarily correspond to nomenclatural guidelines under the ICZN. Since the ICZN does not regulate names above the superfamily rank, our listings of these names are intended to document historical use to aid understanding and resolving the difficult questions of what names are most appropriately used for these suprageneric categories and to what author they should be attributed. For example, the names we list under the Order-level name for turtles (Testudines) are not all strict synonyms, as some were proposed at different levels of groupings, from "Family" to Order to various supra-ordinal categories. Many were utilized primarily for including various fossil turtle-like ancestors in an expanded concept of turtles, including some rank-free Phylocode names. The names we list in other infra-ordinal suprageneric categories are not always strict synonyms either, as based on nomenclatural acceptability or availability of the utilized group name, but instead provide a partial historical record for names previously used for the same or similar grouping. Our formatting in terms of the use of standardized endings and attribution of authorship of names of some groups (e.g., Trionychia, Kinosternoidea) does not always follow a strict application of the ICZN, being more of a partial use and deference to the Phylocode for these suprafamilial categories.

The list includes all currently recognized named taxa (species and subspecies) of modern turtles (extant after 1500 AD). By "currently recognized" we mean those taxa that have not been demonstrably refuted or justifiably synonymized in published literature, or whose resurrection is yet to receive acceptance. We have attempted to describe all recent published taxonomic recommendations in our annotations, even though we have not included all proposed changes in the checklist.

Since there are sometimes also different interpretations for some genera and polytypic species as to which names are valid and whether to lump or split the contained taxa, we occasionally list recent alternative name usages. Our most important criterion for accepting proposed changes is that they be accompanied by adequate data and sound arguments justifying the taxonomic revision. Consequently, some proposed taxonomic changes from lists or publications with unsupported or untested revisions have not been incorporated. We also list and annotate recent systematic papers that do not necessarily commit nomenclatural or taxonomic acts, but that present data on phylogenetic or phylogeographic relationships that either serve to further support currently understood relationships, or are indicators of distinct lineages or potential taxonomic changes to come. Occasionally we also include annotations concerning dates of publication or other bibliographic considerations.

Currently recognized modern turtles and tortoises (genera and terminal taxa, including species and subspe-

cies) are listed in bold italics. Original description names and synonymized names are in non-bold italicized text. Higher suprageneric group-level names are listed in bold non-italic text and are presented in an indented phylogenetic hierarchy. For competing alternative generic names, we list them in phylogenetic order from most to least inclusive. All original names include authorship, year, and page number.

Comments on names that have undergone recent taxonomic change or are associated with instability or uncertainty or other changes are indicated by superscript numbers that refer to annotations at the end of this and earlier checklists. See the **Annotations** section at the end of the checklist for a detailed explanation of the scheme used.

Turtle taxa that have gone extinct within modern times (since 1500 AD) are labeled in bold as Extinct, and are also listed in Table 1. Turtle taxa that were originally described based on recent fossil, subfossil, or archeological material, but subsequently recognized as representing extant taxa or synonymized with modern turtle taxa, are included on the checklist and marked with a cross (†).

The underlined text in parentheses in the checklist ([CBFTT Account](#)) indicates those taxa for which accounts have been published in this monograph series in the TFTSG project on *Conservation Biology of Freshwater Turtles and Tortoises* (CBFTT). The TFTSG and Chelonian Research Foundation will gradually publish CBFTT accounts for all non-marine turtle and tortoise species—accounts also include recognized subspecies within the account, but some subspecies have separate accounts and are so indicated. As of 31 December 2011 we have published 66 accounts.

The checklist includes English common names for all taxa. We have tried to provide the most commonly used names, although occasionally we have provided two or more names. We do not support the practice of designating “official” or “standard” common names for species, as that is the domain for scientific Latin names. Instead, common names tend to evolve and vary from area to area and over time, as well as with language and cultural context. Native vernacular names for certain species are often extensive and imprecise, and we do not list such names here. However, in the conservation arena, the use of reasonably widely recognized and appropriately descriptive common names is critically important for communication purposes, and so we include English common names here. Though also important for the global conservation community, we do not include Spanish or French common names.

We also summarize distributions for all taxa on the checklist, listing all nations and territories in which they occur as native populations (see Tables 2 and 3 for the top turtle-rich nations and the Appendix for full distributional data). For several larger nations we also list political or geographic subunits (e.g., states, provinces, regions, or larger islands). We attempt to also indicate nations or territories where species have been extirpated or where they occur as non-native introduced or invasive species, or where there are uncertainties as to occurrence.

For introductions, we attempt to distinguish between two forms: (1) modern introductions (since ca. 1500 AD) for those species that appear to have relatively well-established or potentially reproducing populations in extra-limital areas primarily as a result of relatively recent trade for food or pets or planned conservation introductions (labeled “introduced” or “modern”), and (2) earlier historic or prehistoric introductions for those species that appear to have native populations, but where population genetics studies find evidence of founder effects suggestive of possible introduction by humans, or other dispersal events, during the last ca. 2000–3000 years (labeled “prehistoric introduction?”).

For freshwater and terrestrial turtles and tortoises, we compiled native and introduced distributions from a combination of multiple published and database sources. For native distributions we used Iverson (1992) and Fritz and

Table 1. Freshwater turtles and tortoises that have gone extinct since 1500 AD, with approximate extinction dates.

Kinosternidae

Kinosternon hirtipes megacephalum

Viesca Mud Turtle
Mexico (Coahuila); ca. 1970

Testudinidae

Aldabrachelys gigantea daudinii or *Dipsochelys dussumieri daudinii*

Daudin's Giant Tortoise
Seychelles (Mahé?); ca. 1850

Chelonoidis nigra

Charles Island Giant Tortoise
Ecuador (Galapagos: Floreana [Charles]); ca. 1850

Chelonoidis phantastica

Narborough Island Giant Tortoise
Ecuador (Galapagos: Fernandina [Narborough]); ca. 1960

Cylindraspis indica

Reunion Giant Tortoise
Réunion; ca. 1840

Cylindraspis inepta

Mauritius Giant Domed Tortoise
Mauritius (Mauritius); ca. 1735

Cylindraspis peltastes

Rodrigues Domed Tortoise
Mauritius (Rodrigues); ca. 1795

Cylindraspis triserrata

Mauritius Giant Flat-shelled Tortoise
Mauritius (Mauritius); ca. 1735

Cylindraspis vosmaeri

Rodrigues Giant Saddleback Tortoise
Mauritius (Rodrigues); ca. 1795

Pelomedusidae

Pelusios seychellensis

Seychelles Mud Turtle
Seychelles (Mahé); ca. 1950

While beyond the time-frame of extinctions for modern turtles, it is worth noting the findings of White et al. (2010), who documented the continuing existence of a giant horned tortoise of the extinct family Meiolaniidae on Efate Island, Vanuatu, in the southwestern Pacific Ocean, as recently as 3100–2800 years before present. They named it *?Meiolania dameli* and provided clear evidence of human butchering and consumption of these animals, representing the final human-induced extinction event for that spectacularly unique and evolutionarily distinct deep lineage of chelonians.

Table 2. The top 25 turtle-rich countries (including ties) for all turtle taxa (species and subspecies) or species per country, including freshwater and terrestrial turtles and tortoises and native sea turtle populations.

| Taxa (sp. & ssp.) | Species |
|----------------------|--------------------------|

Havas (2007) as starting points, added data from our extensive database compiled by Buhlmann et al. (2009), and added further data from the IUCN Red List, our TFTSG-organized IUCN Red Listing workshops, our published CBFTT species accounts, and several other country-specific books and articles by multiple authors. For introduced species, we used Kraus (2009) as a starting point and added data from other publications and online sources and databases. Finally, we also solicited and received input from many members of the TFTSG for corrections and additions to all the native distributions and introductions data. Despite this effort, it is likely that we have committed some errors of omission or commission, and we request that any corrections or updates be brought to our attention so that they can be included in future versions of this checklist.

For sea turtles, we compiled distributions from a combination of IUCN Red List data, CMS (Convention on Migratory Species) listings, and the extensive listings of nesting sites and foraging ranges that the IUCN/SSC Marine Turtle Specialist Group (MTSG) includes in its SWOT mapping application (The State of the World's Sea Turtles) (<http://seaturtlestatus.org/learn/maps/all>), generously supplied to us by the MTSG. Based on these data, we list sea turtle distributions in three distributional categories: 1) nesting: native regularly nesting populations, 2) foraging: native permanently foraging or regularly migrating populations (but no evidence yet of regular nesting),

Table 3. The top 25 turtle-rich countries (including ties) for only freshwater and terrestrial turtle and tortoise taxa (species and subspecies) or species per country, excluding sea turtles.

| | Gabon, 12 |
| | Namibia, 12 |

and 3) vagrant: temporarily foraging or migrating animals not necessarily considered native.

We have also added current IUCN Red List conservation status for all species. The status categorizations listed here are current as of the IUCN Red List of Threatened Species™, version 2011.2 (www.iucnredlist.org). Many species that were determined to be Least Concern in 1996 were never formally listed (as per IUCN Red List protocol at the time), but the original determinations prepared by the TFTSG in 1996 are still available and are now indicated here. As many species on the Red List need updating, either because their previous evaluations are more than ten years old, or because of recent conservation status changes, we have also included the results of TFTSG draft assessments for those species (as of December 2011) to indicate their current provisional status, which should be released on the official IUCN Red List site in the near future. The TFTSG is the official global IUCN Red List Authority responsible for continuously updating IUCN Red List assessments of all tortoises and freshwater turtles, and this process is handled through multiple consensus-building workshops and consultations. For a few species from the South African region we have also added draft Red List assessments done by the South African Reptile Conservation Assessment (SARCA) committee (Hofmeyr et al., in press).

Finally, we have also added CITES (Convention on International Trade in Endangered Species of Wild Fauna

and Flora) status listings on Appendices I, II, or III, current as of the 22 December 2011 listing. As such, this document now brings together most important aspects of taxonomy, names, distribution, and conservation status of all turtles and tortoises of the world.

It is important to note that this list does not constitute an official recommendation by the TTWG or the TFTSG or the IUCN regarding the validity or non-validity of any included or excluded taxonomic names or systematic relationships, as such matters are generally best left to specialists working in these areas. However, we have tried to be consistent in our listing of what appear to be valid taxa and relationships, based on criteria of published scientific descriptions and proposed taxonomic changes accompanied by data and sound argumentation (TTWG 2007a).

Our hope is that through this process, the TTWG and the TFTSG may help stabilize and guide the fluid state of chelonian systematics and nomenclature, and provide a standard reference source for updated taxonomy, systematic relationships, distribution, and conservation status of all turtles and tortoises. The list should also provide an impetus for ongoing and future work aimed at clarifying and resolving areas of taxonomic disagreement and/or uncertainty. It is further foreseen that the TTWG itself may expand and evolve as necessary into a more global endeavor.

Please help the TTWG and the TFTSG keep this Turtles of the World checklist up-to-date by e-mailing any or all of us (addresses noted above) and including pdf's of any relevant articles about new taxonomic or distributional information and/or revisions that should be included and annotated here in upcoming checklists, whether you are an author on a paper providing updated information, or have become aware of data that you believe should be included. Also please inform us of any errors or discrepancies in any of our data, especially for geographic distributions (native or introduced) in countries or states, and for cited refer-

ences and names, so that we may update or correct as necessary. For sea turtle distribution data, please also submit additions and corrections via the SWOT website. We want this checklist to be as accurate, up-to-date, and comprehensive as possible, and ask for your assistance to help us accomplish this goal.

A summary of all major taxonomic changes in this checklist as compared to our previous one is provided in Table 4; all minor changes are only included in the annotations.

CONSERVATION STATUS

To assess and summarize the current conservation status of turtles and tortoises in the broadest strokes, we provide an update and analysis of the most current IUCN Red List (www.iucnredlist.org), as well as provide provisional conservation status of species still under evaluation. The official determinations of conservation status of turtles are provided to the IUCN Red List by the TFTSG, which is continuously producing draft assessments for previously unevaluated taxa as well as previously evaluated taxa needing updates (necessary every 10 years). Knowing the overall conservation status and percentage of threatened species of turtles is important in understanding how seriously they are endangered, and how they compare with other imperiled organisms.

The current IUCN Red List (version 2011.2) formally lists 228 turtle species, 19 separate subspecies, and 1 regional subpopulation, using a slightly different taxonomy from the one presented in this checklist. Of the 228 species listed, 6 are Extinct (EX), 1 Extinct in the Wild (EW), 32 Critically Endangered (CR), 44 Endangered (EN), 58 Vulnerable (VU), 36 Near Threatened (NT), 1 Conservation Dependent (LR/cd; an old category being phased out), 39 Least Concern (LC), and 11 Data Deficient (DD).

By IUCN Red List protocol, Threatened species are defined as those in the three categories of Critically En-

Table 4. Summary of new taxa (*) included in this 2011 checklist and major taxonomic changes from TTWG 2010. See the annotations for a full discussion of all these changes; minor changes associated only with overlooked or previously synonymized names or dates of authorship or other primarily nomenclatural changes are not listed here, but only in the annotations.

| TTWG 2010 | TTWG 2011 | Change |
|---------------------------------------------|---------------------------------------------------------------------------|----------------------------------------|
| <i>Trachemys adiutrix</i> | <i>Trachemys adiutrix</i> or <i>T. dorbigni adiutrix</i> | provisional reduction to subspecies |
| <i>Trachemys callirostris</i> | <i>Trachemys callirostris</i> or <i>T. ornata callirostris</i> | provisional reduction to subspecies |
| <i>Trachemys callirostris chichiriviche</i> | <i>T. callirostris chichiriviche</i> or <i>T. ornata chichiriviche</i> | provisional subspecies reassignment |
| <i>Trachemys emolli</i> | <i>Trachemys emolli</i> or <i>T. grayi emolli</i> | provisional reduction to subspecies |
| <i>Trachemys venusta</i> spp. | <i>T. venusta</i> spp., or <i>T. grayi</i> spp. and <i>T. ornata</i> spp. | provisional reassessment of subspecies |
| <i>Trachemys venusta venusta</i> | <i>T. venusta venusta</i> or <i>T. ornata venusta</i> | provisional reassessment of subspecies |
| <i>Trachemys venusta cataspila</i> | <i>T. venusta cataspila</i> or <i>T. ornata cataspila</i> | provisional subspecies reassignment |
| <i>Trachemys venusta grayi</i> | <i>Trachemys grayi</i> or <i>T. venusta grayi</i> | provisional elevation to species |
| <i>Trachemys venusta panamensis</i> | <i>T. venusta panamensis</i> or <i>T. grayi panamensis</i> | provisional reassessment of subspecies |
| <i>Trachemys venusta uhrigi</i> | <i>T. venusta uhrigi</i> or <i>T. ornata venusta</i> | provisional synonymization |
| <i>Terrapene carolina major</i> | <i>Terrapene putnami</i> † synonymized | extinct species synonymized |
| <i>Cuora evelynae</i> | <i>Cuora flavomarginata evelynae</i> | species reduced to subspecies |
| <i>Gopherus agassizii</i> | <i>Gopherus agassizii</i> and <i>Gopherus morafkai</i> * | new species described |
| <i>Testudo graeca ibera</i> | ? <i>Testudo dagestanica</i> * synonymized | new species tentatively synonymized |
| <i>Testudo graeca armeniaca</i> | ? <i>Testudo dagestanica</i> * synonymized | new species tentatively synonymized |
| <i>Lissemys punctata</i> | <i>Lissemys ceylonensis</i> and <i>Lissemys punctata</i> | species resurrected from synonymy |
| <i>Lissemys punctata punctata</i> | <i>Lissemys p. punctata</i> and <i>Lissemys p. vittata</i> | subspecies resurrected from synonymy |
| <i>Nilssonia</i> or <i>Aspideretes</i> | <i>Nilssonia</i> | genus synonymized |

dangered, Endangered, and Vulnerable, meaning that 134 species are officially regarded as Threatened (58.8% of the 228 species listed, 40.6% of all species), with 76 species (33.3% of those listed, 23.0% of all species) considered Critically Endangered or Endangered.

Of the 330 species recognized as distinct on our checklist, 102 are not yet officially listed on the IUCN Red List. Most of these apparently “unevaluated” species have in fact already been evaluated by the TFTSG, first in 1996, when Least Concern (LC) species were not formally listed (as they are now), and then more recently through a series of draft assessments. Of these 102 species, the TFTSG evaluated 51 as Least Concern in 1996 (J.L. Behler and C. Hilton-Taylor, in litt.), and these are marked as such on this checklist. Further evaluations have more recently been accomplished through an ongoing series of regional IUCN Red Listing workshops held by the TFTSG. These workshops have assessed both previously unevaluated species and updated older previously evaluated species. Since 1999 the TFTSG has held Red Listing workshops in or for Asia, Mexico, the Mediterranean, India, Madagascar, Australia, New Guinea, USA, northern South America, and Asia a second time. Additionally, SARCA has produced draft Red List assessments for South Africa. Although not yet official IUCN Red List evaluations, we can use all these draft evaluations to determine overall threat rates to all turtles and tortoises. The current assessments that are based on the findings and results of these workshops, but have not yet been finalized and published on the IUCN Red List, are included in this checklist as ‘TFTSG Draft 2011’ status.

Combining the formal listed assessments with draft status evaluations for previously unlisted species and draft updated assessments for currently listed but outdated assessments, yields the following total current status numbers for all 330 species of turtles and tortoises: 8 Extinct (EX), 1 Extinct in the Wild (EW), 52 Critically Endangered (CR), 46 Endangered (EN), 51 Vulnerable (VU), 42 Near Threatened (NT), 81 Least Concern (LC), 36 Data Deficient (DD), and 5 Not Evaluated (NE). This yields 149 Threatened species, or 45.2% of all 330 turtles and tortoises, with 98 species (29.7%) Critically Endangered or Endangered.

If we also include EW and EX species among the “Threatened” categories (or more generally, “gone or nearly gone”), then 158 turtle species, or 47.9% of all currently recognized modern turtle and tortoise species, are either already extinct or threatened with extinction.

If we follow the calculation method of determining percentage of Threatened species utilized by Hoffmann et al. (2010) in their major evaluation of extinction risk and conservation impacts in several large vertebrate and plant groups, then the number of Threatened species is divided by the number of data-sufficient species, i.e., the total number of species minus those Not Evaluated and minus those that are Data Deficient. This assumes that Data Deficient species will have the same percentage of Threatened

species as data-sufficient species. Using this calculation methodology, 51.6% of all assessed data-sufficient turtles and tortoises are Threatened, and 54.7% are Threatened or Extinct. For comparison, using the same methods, Hoffmann et al. (2010) determined that 41% of amphibians, 33% of cartilaginous fishes, 25% of mammals, and 13% of birds were Threatened. Turtles were surpassed only by cycads, with 62% of their 300+ species Threatened.

No matter how we analyze these various percentages of threatened species, turtles and tortoises, with anywhere from 45 to 51% of all their modern species Threatened, are among the most endangered of any of the major groups of vertebrate species, more than birds (ca. 13%), mammals (ca. 21–25%), cartilaginous and bony fishes (ca. 17–31%), or amphibians (ca. 30–41%), and paralleled among the larger vertebrate groups only by the primates (ca. 48%) (www.iucnredlist.org, Hoffmann et al. 2010).

Acknowledgments. — We extend special thanks to James Parham, a major contributor and co-author on earlier versions of the checklist, and a source of ongoing incisive input and analytic debate. Specific thanks also for extensive detailed input from Holger Vetter and Peter Uetz. Distributional data on sea turtles from SWOT was gratefully received from Bryan Wallace on behalf of the IUCN/SSC Marine Turtle Specialist Group.

We additionally thank various members of the IUCN/SSC Tortoise and Freshwater Turtle Specialist Group (TFTSG) as well as other individuals who have provided pertinent data or references or helped in various ways with input or review of this and earlier checklists: Kraig Adler, Matt Aresco, Mark Auliya, Ernst Baard, Albert Bertolero, John Bickham, Ortwin Bourquin, Jim Buskirk, Eng Heng Chan, Andrew DiMateo, David Emmett, Alejandro Fallabrino, Balazs Farkas, Oscar Flores-Villela, Uwe Fritz, Arthur Georges, Justin Gerlach, Ute Grimm, Brian Henen, Craig Hilton-Taylor, Margaretha Hofmeyr, Marinus Hoogmoed, Dale Jackson, Fred Janzen, Bob Jones, Ross Kiester, Gerald Kuchling, Minh Le, Thomas Leuteritz, Peter Lindeman, Jeff Lovich, Rod Mast, Russ Mittermeier, Hans-Dieter Philippen, Peter Praschag, Awal Riyanto, Jose Vicente Rueda-Almonacid, Ray Saumure, Chuck Schaffer, Jason Schaffer, Sabine Schoppe, Norman Scott, Will Selman, Shi Haitao, Franco Souza, Phil Spinks, Bryan Stuart, Robert Thomson, Scott Thomson, Oguz Türkozan, and Bruce Weissgold.

The Panaphil Foundation provided partial funding support for PPvD, and HBS was partially supported by a grant from the NSF (DEB-0817042) and the University of California Davis Agricultural Experiment Station. TFTSG-organized IUCN Red Listing workshops and other redlisting efforts have been generously supported by the Frankel Family Foundation, Conservation International, the Turtle Conservancy, the Moore Family Foundation, George Meyer and Maria Semple, Matt Frankel, the Turtle Conservation Fund, Chelonian Research Foundation, and the U.S. Fish and Wildlife Service.

ANNOTATIONS

Areas of taxonomic change or other comments in this or earlier checklists are indicated above by superscripts. Names that were annotated in the earlier checklists are indicated as follows:

1. TTWG 2007b^(1:1 and up)
2. Rhodin et al. 2008^(2:2 and up)
3. TTWG 2009^(3:3 and up)
4. TTWG 2010^(4:4 and up)

Please refer to those publications for those annotations; to facilitate referral back to those earlier checklists, the number after the colon in the superscript (e.g., 1:15, 2:9, 3:22, 4:6) refers to the actual numbered annotation in each checklist. New annotations in the current checklist are simple bold numbers in separate bold parentheses^(5 and up).

5. *Malaclemys terrapin*: Parham et al. (2008) demonstrated, based on radiometric dating of a fossil found in a cave on Bermuda, that the small population of diamondback terrapins present there was the result of a natural dispersal event dating from before human presence on the island. As a result, we now consider the Bermuda population as native rather than introduced. Genetic comparison of Bermuda samples with U.S. populations also demonstrated closest similarity to samples from the Carolinas, so we provisionally list the Bermuda population under the subspecies *M. t. centrata* pending further studies.

6. Genus *Trachemys*: Fritz et al. (2011c) assessed the phylogeny and taxon boundaries of *Trachemys* from Central and South America based on mitochondrial and nuclear DNA. Their nuclear data were largely uninformative, but based on their mitochondrial and combined analyses, they concluded that the Pacific Coast taxa *grayi*, *emollii*, and *panamensis* form a distinct clade that warrants recognition at the species level, as *Trachemys grayi*, with three subspecies. Fritz and co-authors also recommended combining the taxa *cataspila*, *ornata*, *venusta*, *callirostris*, and *chichiriviche*

as subspecies under a single species, *Trachemys ornata*. They further proposed placing *adiutrix* at subspecies level in *dorbigni*, and considered the taxon *uhrigi* to be synonymous with typical *venusta*. Their analysis did not include samples of the taxon *iversoni*, whose range on the Yucatan Peninsula is embedded in the range of the redefined *ornata* group, nor did they sample most *Trachemys* taxa from the arid western region of Mexico.

While Fritz et al. (2011c) provide a useful set of hypotheses for future testing, we recognize that taxonomy of *Trachemys* will remain dynamic and expect further changes when additional nuclear data, and deeper geographic sampling of field-verified specimens, are brought to bear on the problem. We therefore provide the alternative taxonomies of Seidel (2002) and Fritz et al. (2011) in this year's checklist.

7. *Emys/Emydoidea/Actinemys*: Fritz et al. (2011b) reviewed competing generic concepts for Blanding's, Western Pond, and European Pond turtles, and reiterated their support for recognition of *Emydoidea* and *Actinemys* as separate genera distinct from *Emys*.

The TTWG members continue to be deeply divided in their perspectives on whether to recognize three genera, or a single genus, for the four species concerned (*blandingii*, *marmorata*, *orbicularis*, and *trinacris*). The challenge is that available primary research findings result in different relationship trees among the four, based on mitochondrial and nuclear DNA and on morphology (Spinks and Shaffer 2009; Wiens et al. 2010; Fritz et al. 2011b). Overall, the majority of data indicate that *blandingii*, *marmorata*, *orbicularis*, and *trinacris* collectively are each others' closest relatives. Whether to recognize this by combining the four species in an expanded genus *Emys*, or to emphasize the morphological distinctiveness of *blandingii* and *marmorata* from (*orbicularis* + *trinacris*) by recognizing *Actinemys* and *Emydoidea* as monotypic genera, is largely a subjective matter. Correspondingly, the herpetological taxonomic community and recent scientific literature have not come to a clear consensus or prevailing usage. With further research in progress, we agree that the situation remains undecided, and continue to present alternative taxonomies in this year's checklist, with no implication that this represents the preferred or supported arrangement of individual TTWG members.

8. *Terrapene carolina*: Butler et al. (2011) conducted morphological and molecular analyses to address the status of lineages within *Terrapene carolina*. They found that box turtles phenotypically corresponding to *T. c. carolina*, *T. c. bauri*, and *T. c. triunguis* all occur within the range of *T. c. major*, and that the latter does not demonstrate a diagnosable morphology. They also found that *carolina*, *bauri*, and *triunguis* possess divergent mtDNA haplotypes, which are present alongside a fourth, distinct, haplotype in the range of *T. c. major*. Butler et al. interpreted these findings as the introgressed genetic signal of the extinct Pleistocene *T. c. putnami* perpetuating in a morphologically mixed population, and advocated equating the taxon

major with *putnami*; they argued that *major*, which has precedence over *putnami*, should only be used to refer to the large extinct form.

Their genetic analysis also placed *bauri* as sister to *ornata*, and *triunguis* as sister taxon to the [*ornata* + *bauri*] clade. Butler et al. thus suggested that *bauri* should be elevated to species status, although this would leave the remaining taxa in *T. carolina* paraphyletic by continued inclusion of *triunguis*. Butler et al. did not address the status of *mexicana* and *yucatana*, which have variously been considered subspecies of *carolina* or full species each. Furthermore, their analysis did not support the previously recognized species groups (e.g., Milstead 1969; Spinks et al. 2009).

We are reluctant to change the widely-recognized taxonomic arrangement for a species complex of notable conservation and legislative significance based on a single study that relied heavily on a short mtDNA segment. Until the alternative taxonomy presented by Butler et al. is independently corroborated by further research, and potentially finds widespread acceptance in the herpetological and taxonomic communities, we prefer to retain the traditional arrangement and defer possible adoption of their hypothesis until a later version of this checklist.

9. *Cuora flavomarginata evelynae*: In previous checklists we had overlooked that Ota et al. (2009) had transferred *evelynae* back to subspecies status under *Cuora flavomarginata*, but we now follow them here.

10. *Aldabrachelys gigantea* or *Dipsochelys dussumieri*: Gerlach (2011a) studied morphological development of juveniles of the three forms of Indian ocean giant tortoises reared under identical captive conditions, and concluded that animals consistently develop into the morphotypes characterized by their parents. Gerlach thus concluded that the morphotypes cannot be explained by environment alone, and may have a genetic basis, supporting the recognition of *arnoldi* and *hololissa* as taxonomically distinct from *gigantea/dussumieri*.

11. *Gopherus agassizii* and *G. morafkai*: Murphy et al. (2011) investigated taxonomic problems affecting the Desert Tortoise. They designated the sole remaining of three syntypes of *Gopherus agassizii* as lectotype and genetically confirmed that it originated from California. They also determined that the holotype of *G. lepidocephalus* originated from the Mojave desert population, at least based on mitochondrial DNA, reconfirming *lepidocephalus* as a junior synonym of *agassizii*. A suite of morphological, molecular and ecological differences between the Mojave and Sonoran Desert populations led Murphy and co-authors to describe the Sonoran form, long recognized as an Evolutionarily Significant Unit, as a new and distinct species, *Gopherus morafkai*. Further research will be necessary to determine if the southernmost populations of *G. morafkai* in the Sinaloan thornscrub ecosystem also deserve taxonomic recognition (Lamb et al. 1989; Murphy et al. 2011).

12. *Testudo graeca* and *T. marginata*: Chkhikvadze et al. (2011) described *Testudo dagestanica* from Lake Papas,

Dagestan, and considered the taxa *anamurensis*, *pallasi*, *terrestris*, *weissingeri*, and *zarudnyi* (variously considered subspecies or synonyms of *T. graeca* or *T. marginata* in earlier versions of this checklist) as valid subspecies of *T. marginata*. However, Parham et al. (2006) and Fritz et al. (2007) placed the Dagestan population of *Testudo* firmly in *T. graeca* based on a combination of morphological and genetic characters, although those studies differed in their assignment of this population to *T. g. ibera* and *T. g. armeniaca*, respectively. Until further data become available supporting the radical changes proposed by Chkhikvadze et al., we take a conservative approach and make no changes to the taxonomy of *T. graeca* or *T. marginata*.

13. ***Testudo marginata***: Perez et al. (2011) studied the effects of landscape features and demographic history on the genetic structure of *Testudo marginata* using microsatellites. They found that their samples from Sardinia clustered with samples from northern Greece, suggesting that the Sardinian population may have originated from a small founder population approximately 200 generations ago, while the source population from which those founders originated was estimated to be very large. In contrast, the samples from the ‘dwarfed’ *marginata* population of the southwestern Peloponnesus demonstrated a low but significant differentiation from all other *marginata* populations. While Perez et al. did not recommend taxonomic recognition of the dwarf population, they did emphasize the conservation significance of what in effect is an Evolutionarily Significant Unit (ESU).

14. **Genus *Lissemys***: Praschag et al. (2011) analyzed variability across the range of the genus *Lissemys*, based on 2286 bp of mitochondrial DNA sequences, with additional morphological and biogeographical considerations. They concluded that *scutata* is a distinct divergent lineage and reaffirmed Webb’s (1982) conclusion to recognize *scutata* as a full species. They found that the Sri Lankan population shows similar divergence, and recognized this population as a full species, *Lissemys ceylonensis* (Gray 1856a). The remaining populations of *Lissemys* fell into three lineages, one broadly corresponding to the spotted northern taxon *andersoni* (though with some intergradation with unspotted animals in Orissa) inhabiting the Indus-Ganges-Brahmaputra systems, and the other two lineages comprised of unspotted populations in peninsular India. Praschag et al. recommended recognition of the two peninsular lineages by the names *punctata* for the southernmost Indian lineage, and *vittata* for the central Indian lineage. Because the three mainland Indian lineages are more closely related to each other than to either *scutata* or *ceylonensis*, and intergradation between at least *andersoni* and *vittata* is known, Praschag et al. proposed recognition of *vittata* and *andersoni* at subspecies rank under *punctata*. They also concluded that *Emyda granosa intermedia* Annandale 1912, traditionally placed in synonymy of the southern, unspotted form *punctata* (see Webb 1980:554), is based on intergrades between *vittata* and *andersoni* and cannot be used as the valid name for any *Lissemys* taxon. As *intermedia* is clearly not a valid synonym of *andersoni*,

and its type locality (Purulia, western West Bengal) is far outside the redefined range of *L. p. punctata*, we take this opportunity to place *intermedia* into the synonymy of the central unspotted taxon *L. p. vittata*.

15. **Genus *Nilssonia***: In earlier versions of this checklist, we used the provisional designation ‘*Nilssonia* or *Aspideretes*’ as a transitional phase between the widespread usage of *Aspideretes* since Meylan’s (1987) morphological analysis, and the more recent findings that *Aspideretes* is paraphyletic with regard to *Nilssonia* and consequent recommendation to synonymize *Aspideretes* into *Nilssonia* (Engstrom et al. 2004; Praschag et al. 2007; Fritz and Havas 2007). We note that the species *gangetica*, *hurum*, *leithii*, and *nigricans* are now widely accepted as belonging in the genus *Nilssonia*, making *Aspideretes* a synonym.

16. **Genus *Pelodiscus***: Yang et al. (2011) evaluated the validity of *P. parviformis* and inferred it to be a distinct species based on the results of their morphological and molecular analyses. Stuckas and Fritz (2011) sequenced DNA from the lectotype of *P. sinensis* and analyzed its placement in relation to other *Pelodiscus*. They found it distinct from the lineages identified as *P. axenaria* and *P. parviformis*, and concluded that *P. sinensis* is not a senior synonym of either of these two names. Consequently, Stuckas and Fritz proposed recognition of *axenaria*, *maackii*, *parviformis*, and *sinensis* as valid species; they recognized that older names may be available for some of these, but recommended use of these four names for the time being. The respective distribution ranges of the different forms, and possible areas of co-occurrence, remain unclear; the reported occurrence of both *axenaria* and *parviformis* in Guangxi and Hunan warrants further research.

17. ***Rafetus swinhoei***: Farkas et al. (2011) reviewed the description of *Rafetus vietnamensis* Le et al. 2010. They declared *vietnamensis* an objective synonym of *R. leloii*, and reasserted their view that *R. leloii* (and thus *R. vietnamensis*) is a subjective synonym of *R. swinhoei*.

18. ***Trionyx triunguis***: Gidis et al. (2011) sequenced up to seven genes of 20 known-locality samples and reported shallow divergence among Mediterranean Coast, Nile, and Cameroon samples, in contrast to the results of Guçlu et al. (2009), who found four different haplotypes for the four unknown-locality Sub-Saharan specimens that they compared to their Mediterranean samples.

19. ***Pelomedusidae***: Fritz et al. (2011a) examined the phylogeny of *Pelusios* and *Pelomedusa* species based on three mitochondrial and three nuclear DNA fragments. They reported divergent lineages within *Pelusios rhodesianus* and *P. sinuatus*, found no clear differentiation of *P. chapini* from *P. castaneus*, and attributed the nesting of the sole *P. williamsi* sequence within *P. castaneus* to misidentification of the *williamsi* sample in GenBank. They also demonstrated very shallow divergences within *P. castanoides*, suggesting that populations in Madagascar and the Seychelles were only recently colonized; these findings agreed with those of Silva et al. (2010), who found limited mtDNA differentiation of Seychelles from Madagascar specimens of *P. castanoides*,

but cautioned that their sampling of Madagascar material was limited. Fritz et al. (2011a) did not propose explicit changes to taxonomy, but indicated that *chapini* could be re-instated to subspecies rank under *P. castaneus*, and that the recognition of subspecies of *P. castanoides* could be unwarranted; they also suggested the existence of cryptic taxa within *P. rhodesianus* and *P. sinuatus*, and reaffirmed the view of Vargas-Ramirez et al. (2010) that *Pelomedusa subrufa* represents a species complex.

20. Podocnemididae: Gaffney et al. (2011) analyzed the phylogeny of fossil and living species of Podocnemididae in the context of their earlier analysis of extinct related groups (Gaffney et al. 2006). They reconfirmed the monophyly of the family Podocnemididae, and largely agreed with França and Langer (2006) in not recognizing Erymnochelyinae as a subfamily.

APPENDIX – DISTRIBUTIONAL DATA

Distribution Updates: Having introduced distribution data in last year's checklist, we record a number of updates and corrections that have been made in this year's checklist.

Dermatemys mawii: Honduras (?) deleted from the range as per CBFTT account (Vogt et al. 2011).

Kinosternon scorpioides albogulare: Population in San Andrés, Colombia, indicated as possible prehistoric or modern introduction, as per CBFTT accounts (Berry and Iverson 2011, Forero-Medina and Castaño-Mora 2011).

Chrysemys dorsalis: Apparently established in Florida (Krysko et al. 2011).

Graptemys pseudogeographica: Apparently established in Florida (Krysko et al. 2011).

Malaclemys terrapin and *M. t. centrata*: Bermuda added to native range (Parham et al. 2008).

Pseudemys nelsoni: Introduced to Tortola, British Virgin Islands (Owen et al. 2005).

Trachemys scripta scripta: Apparently established in Florida (Krysko et al. 2011).

Emys orbicularis orbicularis: Spain deleted from range; Spanish populations are attributable to subspecies *E. o. fritzjurgenobsti* and *E. o. galloitalica*, but not to the nominate subspecies.

Terrapene nelsoni: Chihuahua, Mexico (*T. n. klauberi*) and Jalisco, Mexico (*T. n. nelsoni*) added to the range, as per CBFTT account (Buskirk and Ponce-Campos 2011).

Batagur kachuga: Occurrence in Nepal confirmed.

Cuora bourreti: Occurrence in Laos indicated as uncertain.

Cuora picturata: Occurrence in central Vietnam confirmed (Ly et al. 2011).

Cuora zhoui: Vietnam added as uncertain occurrence.

Geoemyda spengleri: Laos added to the range (Stuart et al. 2011).

Mauremys caspica caspica: Israel, Jordan and Lebanon deleted from the range; populations there attributable to *M. rivulata*. Turkmenistan added to the range.

Mauremys caspica siebenrocki: Turkmenistan deleted from the range; population there attributable to *M. c. caspica*.

Sacalia bealei: Occurrence in Guangxi, China, indicated as uncertain.

Aldabrachelys/Dipsoschelys gigantea/dussumieri hololissa: Cousine Island added to extirpated range, Round and Cousine

islands added to introduced range, as per CBFTT account (Gerlach 2011b).

Stigmochelys pardalis: Sudan deleted from the range, and the new nation of South Sudan added to the range.

Pelodiscus parviformis: Vietnam added to the range.

Acanthochelys pallidipectoris: Mendoza, Argentina, corrected from native range to introduced, as per CBFTT account (Vinke et al. 2011).

South Sudan: This newly independent nation has seven taxa of freshwater turtles and tortoises: *Kinixys belliana belliana*, *Stigmochelys pardalis*, *Cyclanorbis elegans*, *Cyclanorbis senegalensis*, *Trionyx triunguis*, *Pelomedusa subrufa*, and *Pelusios adansonii*.

We seek comments and encourage reader input on any distribution data that improves the accuracy of our listings, but especially on the accuracy (or not) of the following possible occurrences:

Cuora bourreti: Cambodia (?), Laos (?);

Cuora zhoui: Guangxi, China (?), Vietnam (?);

Melanochelys trijuga edeniana: Yunnan, China (?);

Morenia ocellata: Yunnan, China (?);

Sacalia bealei: Guangxi, China (?);

Kinixys belliana subspecies: the precise distribution of these taxa needs further clarification.

Distribution of Tortoises and Freshwater Turtles: Freshwater and terrestrial turtles and tortoises (excluding sea turtles) have now been recorded as occurring in 162 nations or territories (excluding introductions, but including 8 countries where these taxa have been extirpated in modern times). These 162 countries are as follows, including the number of taxa of freshwater turtles and tortoises (species and additional subspecies) known to be native or presumed (?) to probably occur in the country.

Afghanistan, 2; Albania, 5; Algeria, 4; Angola, 12; Argentina, 12; Armenia, 5; Australia, 28; Austria, 1; Azerbaijan, 6; Bahamas, 2; Bahrain, 1; Bangladesh, 24; Belarus, 1; Belgium (extirpated), 1; Belize, 9; Benin, 11; Bermuda, 1; Bolivia, 14; Bosnia and Herzegovina, 4; Botswana, 9; Brazil, 30; Brunei, 10; Bulgaria, 4; Burkina Faso, 6; Burundi, 8; Cambodia, 16; Cameroon, 11; Canada, 12; Cape Verde, 1; Cayman Islands, 1; Central African Republic, 10; Chad, 7; China, 30; Colombia, 28; Congo (DRC), 20; Congo (ROC), 11; Costa Rica, 9; Croatia, 4; Cuba, 2; Cyprus, 1; Czech Republic (extirpated), 1; Denmark (extirpated), 1; Djibouti, 1; Dominican Republic, 2; Ecuador, 26; Egypt, 3; El Salvador, 4; Equatorial Guinea, 7; Eritrea, 5; Estonia (extirpated), 1; Ethiopia, 9; France, 4; French Guiana, 10; Gabon, 12; Gambia, 5; Georgia, 5; Germany, 1; Ghana, 9; Greece, 5; Guatemala, 13; Guinea, 5; Guinea-Bissau, 5; Guyana, 11; Haiti, 2; Honduras, 12; Hungary, 1; India, 36; Indonesia, 33; Iran, 10; Iraq, 5; Israel, 4; Italy, 7; Ivory Coast, 8; Jamaica, 1; Japan, 6; Jordan, 2; Kazakhstan, 3; Kenya, 10; Kuwait, 1; Kyrgyzstan, 2; Laos, 19; Latvia, 1; Lebanon, 3; Lesotho, 2; Liberia, 6; Libya, 4; Lithuania, 1; Luxembourg (extirpated), 1; Macedonia, 4; Madagascar, 11; Malawi, 10; Malaysia, 20; Mali, 6; Mauritania, 6; Mauritius (extirpated), 4; Mexico, 58; Moldova, 1; Mongolia, 1; Montenegro, 3; Morocco, 6; Mozambique, 10; Myanmar, 28; Namibia, 13; Nepal, 15; Netherlands (extirpated), 1; Nicaragua, 11; Niger, 4; Nigeria, 11; North Korea, 2; Pakistan, 11; Panama, 11; Papua New Guinea, 11; Paraguay, 11; Peru, 16; Philippines, 7; Poland, 1; Portugal, 2; Puerto Rico, 1; Réunion, 1; Romania, 3; Russia, 6; Rwanda, 7; São Tomé and Príncipe, 1; Saudi Arabia, 2; Senegal, 8; Serbia, 5; Seychelles, 7; Sierra Leone, 6; Singapore, 9; Slovakia, 1; Slovenia, 3; Somalia, 5; South Africa, 20; South Korea, 2; South Sudan, 7; Spain, 4; Sri Lanka, 4; Sudan, 7; Suriname, 9; Swaziland, 6; Switzerland (extirpated), 1; Syria, 6; Taiwan, 6; Tajikistan, 2; Tanzania, 14; Thailand, 27;

Timor-Leste, 2; Togo, 9; Trinidad and Tobago, 6; Tunisia, 4; Turkey, 11; Turkmenistan, 7; Uganda, 10; Ukraine, 1; Uruguay, 5; USA, 82; Uzbekistan, 4; Venezuela, 21; Vietnam, 29; Yemen, 1; Zambia, 11; Zimbabwe, 10.

Distribution of Marine Turtles: Sea turtles have now been recorded as occurring in 168 nations or territories (excluding cases of presumed vagrancy). These 168 countries are as follows, including the number of species recorded to be nesting or regularly foraging in the country.

Albania, 2; Algeria, 2; American Samoa, 2; Angola, 3; Anguilla, 4; Antigua and Barbuda, 4; Argentina, 2; Aruba, 4; Ascension, 2; Australia, 6; Bahamas, 4; Bahrain, 4; Bangladesh, 5; Barbados, 4; Belize, 4; Benin, 4; Bermuda, 3; Bonaire, 1; Brazil, 5; British Indian Ocean Territory, 2; British Virgin Islands, 4; Brunei, 4; Cambodia, 4; Cameroon, 4; Canada, 2; Cape Verde, 3; Cayman Islands, 3; Chile, 3; China, 5; Christmas Island, 1; Cocos (Keeling) Islands, 1; Colombia, 5; Comoros, 4; Congo (DRC), 3; Congo (ROC), 4; Cook Islands, 2; Costa Rica, 5; Croatia, 2; Cuba, 4; Curacao, 4; Cyprus, 3; Djibouti, 4; Dominica, 4; Dominican Republic, 4; Ecuador, 4; Egypt, 5; El Salvador, 4; Equatorial Guinea, 4; Eritrea, 4; Fiji, 4; France, 2; French Guiana, 5; French Polynesia, 2; French Southern Territories, 2; Gabon, 4; Gambia, 5; Ghana, 4; Great Britain, 1; Greece, 3; Grenada, 4; Guadeloupe, 4; Guam, 2; Guatemala, 5; Guinea, 4; Guinea-Bissau, 5; Guyana, 5; Haiti, 4; Honduras, 5; India, 5; Indonesia, 6; Iran, 4; Iraq, 3; Ireland, 1; Israel, 5; Italy, 2; Ivory Coast, 4; Jamaica, 4; Japan, 4; Kenya, 5; Kiribati, 1; Kuwait, 3; Lebanon, 3; Liberia, 5; Libya, 3; Madagascar, 5; Malaysia, 4; Maldives, 3; Malta, 2; Marshall Islands, 2; Martinique, 4; Mauritania, 4; Mauritius, 5; Mayotte, 2; Mexico, 6; Micronesia, 3; Monaco, 2; Montenegro, 2; Montserrat, 3; Morocco, 2; Mozambique, 5; Myanmar, 5; Namibia, 3; Nauru, 1; Netherlands Antilles, 4; New Caledonia, 3; New Zealand, 1; Nicaragua, 5; Nigeria, 4; Niue, 1; North Korea, 2; Northern Mariana Islands, 1; Oman, 4; Pakistan, 4; Palau, 3; Panama, 5; Papua New Guinea, 6; Peru, 5; Philippines, 5; Portugal, 2; Puerto Rico, 4; Qatar, 4; Réunion, 3; Russia, 1; Saint Kitts and Nevis, 4; Saint Lucia, 4; Saint Vincent and the Grenadines, 4; Samoa, 4; São Tome and Príncipe, 4; Saudi Arabia, 4; Senegal, 5; Seychelles, 5; Sierra Leone, 5; Singapore, 3; Sint Maarten, 4; Slovenia, 2; Society Islands, 1; Solomon Islands, 4; Somalia, 4; South Africa, 4; South Korea, 2; Spain, 2; Sri Lanka, 5; Sudan, 4; Suriname, 5; Syria, 3; Taiwan, 4; Tanzania, 5; Thailand, 4; Timor-Leste, 2; Togo, 4; Tokelau, 1; Tonga, 4; Trinidad and Tobago, 5; Tuamotu, 1; Tunisia, 2; Turkey, 3; Turks and Caicos, 4; Tuvalu, 2; United Arab Emirates, 4; Uruguay, 3; US Virgin Islands, 4; USA, 6; Vanuatu, 5; Venezuela, 5; Vietnam, 5; Wallis and Futuna, 2; Western Sahara, 2; Yemen, 4.

LITERATURE CITED

This bibliography is divided into two sections: (1) all **primary taxonomic citations** noted in this checklist, including all descriptions of new species, subspecies, and genera, replacement names (*nomena nova*) for all taxa and genera, and cited suprageneric names, and (2) **additional literature cited** in the introduction and in the annotations to the current checklist, including taxonomic revisions and related publications that do not contain primary taxonomic citations.
